# BEARING CHARACTERISTICS

## Characteristics of bearing types and application

### Deep Groove Ball Bearings

Deep groove ball bearings are non-separable, comparatively rigid radial bearings, their balls are guided in deep radial running grooves. They are characterized by a high radial and axial load carrying capacity and can operate at very high speed.

Combined loads are accommodated to an optimum degree - in fact, at higher speeds they are often better suited to transmit thrust loads than the ball thrust bearing. For these reasons and their economical price, it is the most widely used bearing.

Deep groove ball bearings are also available with one or two non-rubbing metal shields (Z, ZZ) or rubbing seals (RS, 2RS) made from synthetic rubber. Bearings with two shields or two seals are pre-lubricated with the correct quantity of grease of a lithium base which permits operating temperatures of  $-30^{\circ}\text{C} + 120^{\circ}\text{C}$  ( $-22^{\circ}\text{F} + 248^{\circ}\text{F}$ ).

Deep groove ball bearings with snap ring groove (N) and snap ring (R) in the outer ring enables a simple and space-saving axial location in the housing.

### Angular Misalignment

The following is an approximate guide to the misalignment that can be accommodated in the use of a single row ball bearing:

0.0010 radians

A greater degree of misalignment can sometimes be accommodated if pure radial load is applied, particularly if the misalignment results from occasional peak load, and if the bearing had sufficient radial internal clearance after mounting to avoid excessive stresses.

## Angular Contact Ball Bearing

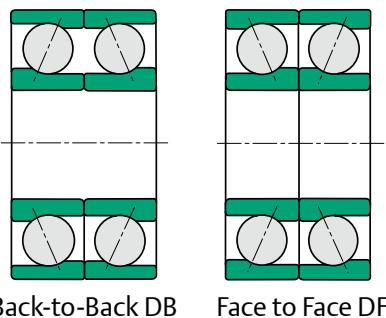

There are single-row and double-row angular contact bearings and also duplex (four point contact bearing). Single-row angular contact ball bearings are non-separable and the standard types feature a contact angle of 40°. They are suitable for the accommodation of combined (radial and axial) loads. Axial loads may be transmitted in the direction of the closed faced or high shoulder only.

Optimum load transmission starts with  $F_a \geq F_r$ . Radial forces induce internal axial forces which are absorbed by the opposed bearing. Such bearings should therefore be mounted in pairs, and should be adjusted against another bearing. In the case of length variations of the shaft caused by changes in temperature, which also affects the internal clearance, the distance between the bearings should be kept small.

The maximum permissible speed is somewhat lower than that of deep groove ball bearings. A slight angular deflection is still possible with the single bearing; if bearings are mounted in pairs, however, rigidity greatly increases together with the ability to prevent misalignment.

Single-row angular contact bearings can also be supplied with side faces ground for mounting side-by-side. Suffixes Df, DB, and DT are being used in the bearing designation, ie 7250 BG. They can be mounted in any of three combinations depending on the loading characteristics:

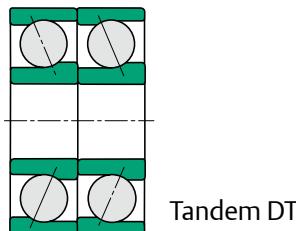

- A back-to-back arrangement (closed face together, load line of the bearings diverging towards the shaft axis) is used where rigidity and an ability to absorb fitting moment is required.

- A face-to-face arrangement (open faces together, load line of the bearings converging on shaft axis) is used where axial loads acting in both directions are to be catered for by one bearing in one direction.

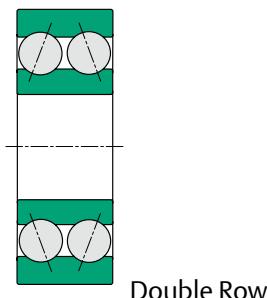

Rigidity is better in the back-to-back arrangement. In the face-to-face arrangement, there is less ability to absorb fitting moments.

- A tandem arrangement (open face-to-closed-face load lines being parallel to each other) is used for thrust loads equally distributed over all bearings, absorbed in one direction only. Adjustment against another bearing which accommodates the opposed thrust load is necessary.

## Double Row Angular Contact Bearings

The inner and outer ring of these bearings each have a double raceway, and the two rows of balls have contact angles that are similar to a back-to-back arrangement. Thrust loads can be accommodated in either directions as well as fitting moments.

## Four Point (Duplex)

The ‘four-point’ contact bearings, or duplex bearings, are in principle angular contact bearings that accommodate axial loading in both directions. They usually have more axial movement than a pair of angular contact bearings correctly adjusted endwise; they are also able to carry combined radial and axial loading, providing the axial load exceeds the radial load at all times. Duplex bearings should not run unloaded, particularly at high speeds, for in this condition the balls contact the raceways at three or four points instead of two points necessary to correct running. Three or four point contact results in over-heating due to the balls skidding. When duplex bearings are required to carry axial loads only, then the outer rings must have radial clearance in the housing.

## **Angular Misalignment**

The following is an approximate guide to the misalignment that can be prevalent when fitting angular contact bearings:

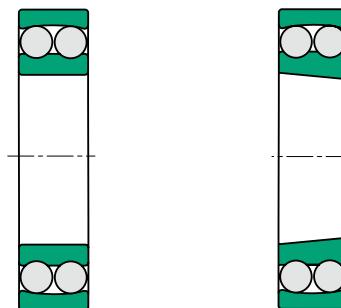

0.0003 radians

Greater misalignment, particularly under pure axial load, can become critical.

## **Double Row Self-Aligning Ball Bearings**

This design of bearing utilizes two rows of balls, with the inner ring having two deep groove raceways and the outer ring a single continuous spherical raceway. This permits the inner and outer ring to be misaligned relative to each other through a comparatively large angle without imposing moment loads upon the balls. This bearing is frequently used when the inner ring is to be mounted upon an adapter sleeve or when conditions in the machine make it difficult to assure accurate alignment of the inner and outer rings.

Due to the small contact angle, the thrust capacity of these bearings is limited.

Cylindrical Bore

Tapered Bore 1:12

## **Angular Misalignment**

The following is an approximate guide to the misalignment that can be accommodated in a double row self-aligning ball bearing:

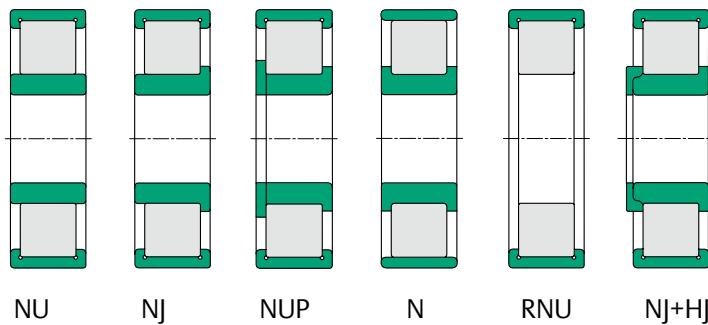

0.04 radians between 2.5 and 3 degrees depending on which series is used.

| Bearing series | Permissible Angular Misalignment Degrees |
|----------------|--|
| 1200 – 1222    | 2.5                                      |
| 1302 – 1318    | 3  |
| 2200 – 2222    | 2.5                                      |
| 2300 – 2318    | 3  |

## Cylindrical Roller Bearings

The rollers of these bearings are essentially cylindrical in shape, providing modified line contact with the cylindrical inner and outer ring raceways. The rollers are accurately guided by ground ribs on either the inner ring or the outer ring, thus making these bearings suitable for heavy radial loads and high speed operation. For best results, these bearings should be accurately aligned.

The cylindrical shape of the rollers allows the inner ring to have considerable axial movement relative to the outer ring. This feature is valuable in accommodating thermal expansion in applications where both the inner ring and outer ring must be press-fitted. Also, since the inner and outer rings are separable from each other, the assembly of equipment is frequently facilitated.

## Angular Misalignment

the following is an approximate guide to the misalignment that can be accommodated in a cylindrical roller bearing:

0.0004 radians

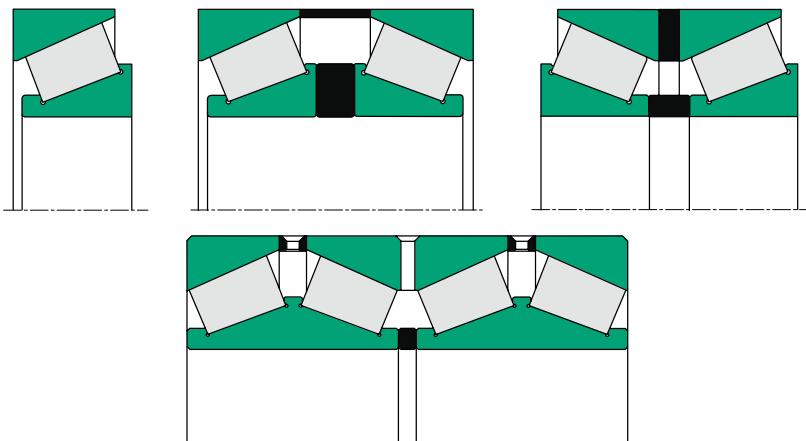

Greater misalignment under heavy radial load can be critical.

## Tapered Roller Bearings

This design utilizes conical rollers and raceways arranged so that all elements of the roller and raceway cones meet at a common apex on the axis of rotation. The rollers are guided by contact between the large end of the roller and a rib on the high capacity for radial loads and single direction thrust loads.

The bearings are usually mounted in pairs with axial adjustment to provide proper running clearance within the bearings. Being separable, inner and outer rings may be mounted individually.

For heavy thrust loads, the type 30300 with large contact angle is desirable. Tapered roller bearings with two and four rows of rollers are used for special applications.

## Angular Alignment

The following is an approximate guide to the misalignment that can be prevalent when fitting tapered roller bearings:

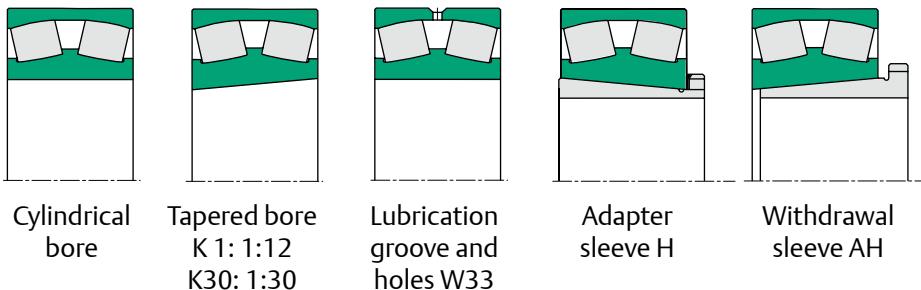

2 mins of arc

This is under normal loading conditions.

## Spherical Roller Bearings

In this design, two rows of rollers operate in separate raceways ground into the inner ring with guide rib to guide the rollers. The outer ring has a single spherical raceway, thus allowing the inner ring and rollers to freely compensate for angular errors due to inaccurate machine components or due to elastic deflection of the shaft or housing under load.

As a result of the line contact, a large number of rollers, and the substantial contact angle, these bearings have large radial and thrust load capacity. They are suitable for heavy shock and impact loads and thus are extensively used in steel mills, rock crushers, and heavy industrial equipment.

## Angular Misalignment

The following is an approximate guide to the misalignment that can be accommodated in a spherical roller bearing-between 1 and 2,5 degrees depending on which series is being used:

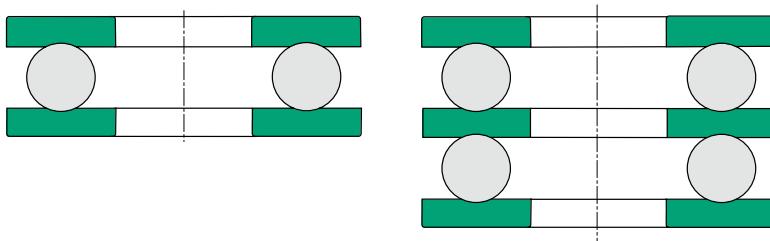

| Bearing series | Permissible angular misalignment degrees |
|----------------|--|
| 213            | 1  |
| 222            | 1.5                                      |
| 223            | 2  |
| 230            | 1.5                                      |
| 231            | 1.5                                      |
| 232            | 2.5                                      |
| 240            | 2  |
| 241            | 2.5                                      |

## Thrust Ball Bearings

Thrust ball bearings are separable bearings. The single-acting thrust ball bearing consists of shaft washer, housing washer and ball set with cage, the double-acting type of a shaft washer ( centre washer), two housing washer and two ball sets with cages.

Thrust ball bearings can be applied for high axial loads and low to medium speeds, they cannot, however, take radial loads. They are sensitive to angular deflection and characterized by extremely rigid guidance in axial direction.

Depending on speed a minimum load is necessary to avoid sliding movements of the ball set, which are caused by centrifugal forces. To compensate for misalignments of the shaft, bearings with spherical housing washers and support washers should be used.

## BEARING SELECTION

The following procedure gives the steps to be followed when bearings are selected from the information contained in this catalog. It will be found satisfactory for most applications.

1. Determine the speed of the bearing.  
Calculate the loads on the bearings.
2. Establish if accurate alignment can be obtained between the bearing seatings. If it cannot, then bearings that accommodate misalignment should be selected.
3. If the bearings rotate under load decide the life required, calculate the required dynamic load rating 'C' values, and then select suitable bearings that have comparable 'C' values.  
If the bearings do not rotate under load selected them by using the static load rating ' $C_0$ '.
4. Check if the bearings are suitable for the speed and decide of grease or oil is to be the lubricant.
5. Select a suitable bearing arrangement of this is not already known; make sure that the seating fits required can be used with this arrangement.
6. Decide if bearings to 'Standard' or 'Extra Precision' limits of accuracy are required.  
Select the most suitable range of radial clearance.  
Choose the abutment diameters.  
Choose suitable closures.  
Issue mounting and handling instructions for the bearings if necessary.

## Selecting Of Bearing Type

Each type of bearing has different properties, making it suitable for certain applications. The factors to be considered when choosing a bearing are numerous, so guidance is given to the main points when selecting a bearing. It must also be remembered that special consideration must be given to aspects relating to the running and operating, and to aspects relating to cases where at least one of the principal dimensions of the bearing has been determined by the machine design or shaft size.

## Load And Direction Of Load

The magnitude and direction of the external loads, along with built in factors of safety, are two of the main points which determine the bearing size - and in some instances - the bearing type to be used. The important factors are the speed of rotation, temperature, the amount of precision required, mounting conditions, and running noise.

The following illustrations indicate the magnitude and direction of the external loads which the bearings will provide for.

### Radial Loads

For light and medium radial loads, ball bearings are generally used; whereas for heavy loads and large shaft diameters, roller bearings are often the only choice.

Cylindrical roller bearings are available in several types. Types NU (with outer ring ribs), and N (with inner ring ribs) are only suitable for radial loads, whereas the NUP, NJ, and NJ with angle ring HJ can be used to a certain extent to take combined loads.

### Thrust Loads

Thrust ball bearings are only suitable for light or medium purely axial loads. Double-acting thrust ball bearings can carry thrust loads in either direction. Spherical roller thrust bearings are used where heavy thrust loads are to be absorbed, and in addition can carry a certain amount of radial load acting simultaneously.

### Combined Loads

If a radial and thrust load act on a bearing simultaneously, this is termed as a 'Combined Load'. The most important feature affecting the ability of carry axial loads is the angle of contact in relation to the shaft axis. The greater the angle, the more suitable the bearing is to accommodate axial loading. Combined loads are carried by deep groove ball bearings, self-aligning ball bearings, four point bearings, single and double row angular contact bearings, spherical roller bearings, cylindrical roller bearing of the locating types and taper roller bearings.

## **Limiting Speed**

The speeds at which bearings can rotate are limited by the bearing type, the operating load and the permissible operating temperature of the lubricant.

Bearings with low frictional resistance, and correspondingly low internal heat generation, are most suitable for high speeds with proper attention being given to the correct bearing clearance after mounting.

For radial loads the bearings most suitable are deep groove ball bearings or cylindrical roller bearings. For combined loads angular contact bearings should be selected.

## **Misalignment**

Self aligning ball bearings, spherical roller bearings and spherical roller thrust bearings allow, at assembly, for the correction of misalignment where the shaft can be misaligned relative to the housing. Values for permissible angular misalignment are listed in the tables which precede the bearing sizes of those particular types.

## **Low Noise Level**

Even though the running noise of rolling bearings is so low that it is lost in the background noise of other moving parts. It is sometimes of prime importance to reduce this to a minimum level for electric motors used, for example, in lifts for hospitals and hotels, and other domestic appliances. Such applications usually demand the fitting of a deep-groove ball bearing selected for low noise level.

## **Rigidity**

This is sometimes a very important requirement, especially on machine tool spindles, where rigidity controls the bearing selection. In applications of this nature, single or double row cylindrical roller bearings or taper roller bearings are best suited, compared with the point contact of ball bearings. The stiffness can be further enhanced by pre-loading.

## **Axial Movement**

In a normal bearing arrangement supporting a shaft, it is usual to locate one bearing (fixed) and allow the non locating bearing (free) to float in the housing, thus preventing axial pre-load as a result of thermal expansion of the shaft. Axial movement produced by thermal expansion can be accommodated by the use of a cylindrical roller bearing of the N or NU pattern. This allows axial movement to occur by displacement of the rollers over the track.

## **Tapered Bore And Sleeve Mounting**

Tapered bore bearings are used for easier mounting and adjustments of the radial clearance. It is usual to fit sleeve bearings on a bright drawn steel bar, thus cutting machining costs and simplifying assembly. Withdrawal sleeves are used to ease the removal of the bearing. The residual clearance should be checked with the tables relating to the axial drive-up for spherical roller bearings and the bearing size.

## **Precision**

Rolling bearings with a higher degree of precision than normal are required for shafts where running accuracy is of prime importance - for example, machine tools spindles and shafts rotating at very high speeds (see section relating to bearing tolerances).

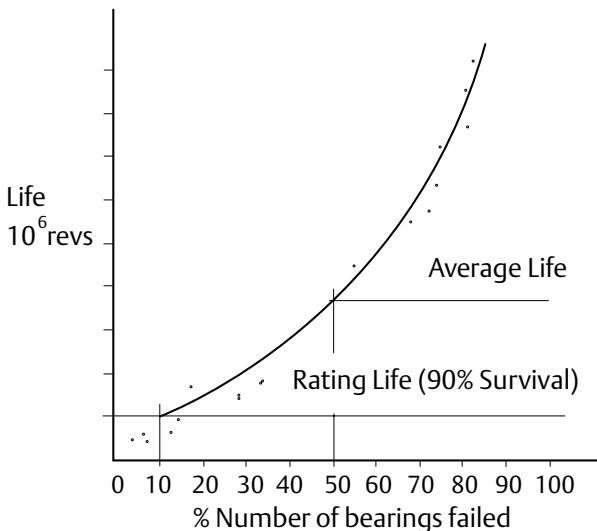

# BEARING LIFE AND LOAD RATINGS

## Determination Of Rolling Bearing Size

To determine the size of the bearing, static and dynamic load conditions and design life requirements must be considered. The load ratings for the size and type are given in the bearing tables on the appropriate pages.

### Dynamic Loading

When a batch of apparently identical bearings is tested under identical load, speed, and operating conditions, a wide difference is obtained in the lives of the bearings. Typical results are plotted below - this graph shows the 'rating life' (sometimes called the '90 per cent survival life'). This is the calculated life obtained by following the procedure set out in this catalogue. Also shown is the average life, which is appreciably greater than the 'rating life'.

The reason for this difference is that even with the best steel, minute imperfections exist in the material. As the area of contact between the rolling elements and rings under load is very small, these imperfections upset the distribution and intensity of stress in the material. Variations in contact area, resulting from the manufacturing tolerances on the rings and rolling elements, also contribute towards this difference.

In addition to the load conditions on a bearing, failure can also result from other factors - notably, lack of attention to lubrication, protection, or accuracy of mounting. These cannot be included in the basic load/life formulae.

The required basic static load rating  $C_0$  of a bearing can be determined using the equation:

$$C_0 = S_0 P_0$$

where:

$C_0$  = basic load rating [KN]

$P_0$  = equivalent static load [KN]

$S_0$  = static safety factor

For bearings operating in elevated temperatures, the hardness of the bearing material will be reduced.

Values of  $S_0$  for a few typical non rotating bearing applications are shown below and may be used as a guide.

| Application  | $S_0$ Factor |
|--|--------------|
| Variable pitch propeller blades on aircraft                      | 0.5          |
| Dams on aircraft   | 1.0          |
| Swing bridges  | 1.5          |
| Crane hooks for large cranes without additional dynamic forces   | 1.5          |
| Small cranes for bulk goods with large additional dynamic forces | 1.6          |

On rotating bearings where the load fluctuates dramatically, or where heavy shock loads occur during a fraction of a revolution, it is necessary to check that the basic static load rating is adequate. Heavy shock loads could cause permanent deformation, in the form of indentation being unevenly distributed over the raceway. Shock loads are also generally such that they cannot be calculated exactly. In some cases, they may also cause deformation of the housing, producing unfavorable load distribution. Depending on the operating conditions, the maximum load should not exceed a value determined by the static safety factor  $S_0$ .

Values for  $S_0$  for certain operating conditions can be used.

| Operating Conditions                                | $S_0$ Factor (min <sup>m</sup> ) |
|---|----------------------------------|
| Operation is smooth and vibration free              | 0.5                              |
| Operation is normal and vibration conditions normal | 1.0                              |
| Pronounced shock loads                              | 1.5 – 2                          |
| Demand on smooth running is of prime importance     | 2.0                              |
| For spherical roller thrust bearing                 | $\geq 4$                         |

## **Basic Dynamic Load Rating Cr**

Basic dynamic load rating (Cr) is defined as that constant radial load which a group of apparently identical radial ball bearings, angular contact ball bearings, and radial roller bearings can endure for a rating life of one million revolutions.

For thrust ball bearings the basic dynamic load rating is that constant, central, axial load which a group of apparently identical thrust bearings can endure for a rating life of one million revolutions.

## **Static Load Rating Co**

The static load Co is defined as a load acting on a non-rotating bearing.

Permanent deformations appear in rolling elements and raceways under static load of moderate magnitude and increase gradually with increasing load. The permissible static load is, therefore, dependent upon the permissible magnitude of permanent deformation.

Experience shows that a total permanent deformation of 0.0001 of the rolling element diameter, occurring at the most heavily loaded rolling element and raceway contact, can be tolerated in most bearing applications without impairment of bearing operation.

## **Rating Life**

Rating life (L) is defined as the number of revolutions (or hours at some constant speed) that 90% of a group of apparently identical bearings will exceed before the first evidence of fatigue develops. This may be referred to as B10 life.

## LIFE EQUATION

The expression  $Lu = (C/P)^3 [10^6 \text{ revs}]$  is used to establish a mathematical relationship for the rating life as a function of the load where:

- $Lu$  = rating life in millions of revolutions of the inner ring with constant direction of loading
- $C$  = basic dynamic load rating in [ $\text{KN}$ ]
- $P$  = equivalent dynamic load rating in [ $\text{KN}$ ]
- $p$  = exponent for life equation
- $p$  = 3 for ball bearings
- $p$  =  $10/3$  for roller bearings.

In most cases it is common practice to employ the rating life  $L_h$  (hours). The relationship between  $Lu$  and  $L_h$  with constant rotational speed  $n$  (rpm) is

$$Lu = \frac{L_h \cdot n \cdot 60}{10^6} \cdot [10^6 \text{ revs}]$$

If the rating life of  $1 \times 10^6$  revs, to which the basic load rating  $C$  refers, is resolved into a reference life  $L_h = 500$  hours, and a reference rotation speed of  $n = 33.1/3$  rpm it follows that:

$$\text{for ball bearings for roller bearings: } \left(\frac{C}{P}\right) \cdot \frac{10}{3}$$

$$Lu = \frac{L_h \cdot n \cdot 60}{500 \cdot 33.1/3 \cdot 60} = \left(\frac{C}{P}\right)^3 [10^6 \text{ revs}]$$

$$\text{or: } \sqrt[3]{\frac{Lu}{500}} = \sqrt[3]{\frac{33.1/3}{n}} \cdot \frac{C}{P}$$

$$\text{letting: } \sqrt[3]{\frac{33.1/3}{n}} = \text{speed factor } f_n \text{ (equation 1)}$$

$$\text{and: } \sqrt[3]{\frac{Lu}{500}} = \text{life factor } f_L \text{ (equation 2)}$$

The rating life equation may be obtained in the form life factor:  $f_L = \frac{C \cdot f_n}{P}$

$$\text{basic load rating required: } C = \frac{P \cdot f_L}{f_n} \quad [\text{KG}]$$

The relationship of equation 1 and 2 are graphically represented in nomograms below. Also on page 20 are charts showing the L<sub>10</sub> life in relation to C/P for ball and roller bearings.

## LIFE "L" IN MILLIONS OF REVOLUTIONS DEPENDING ON C / P

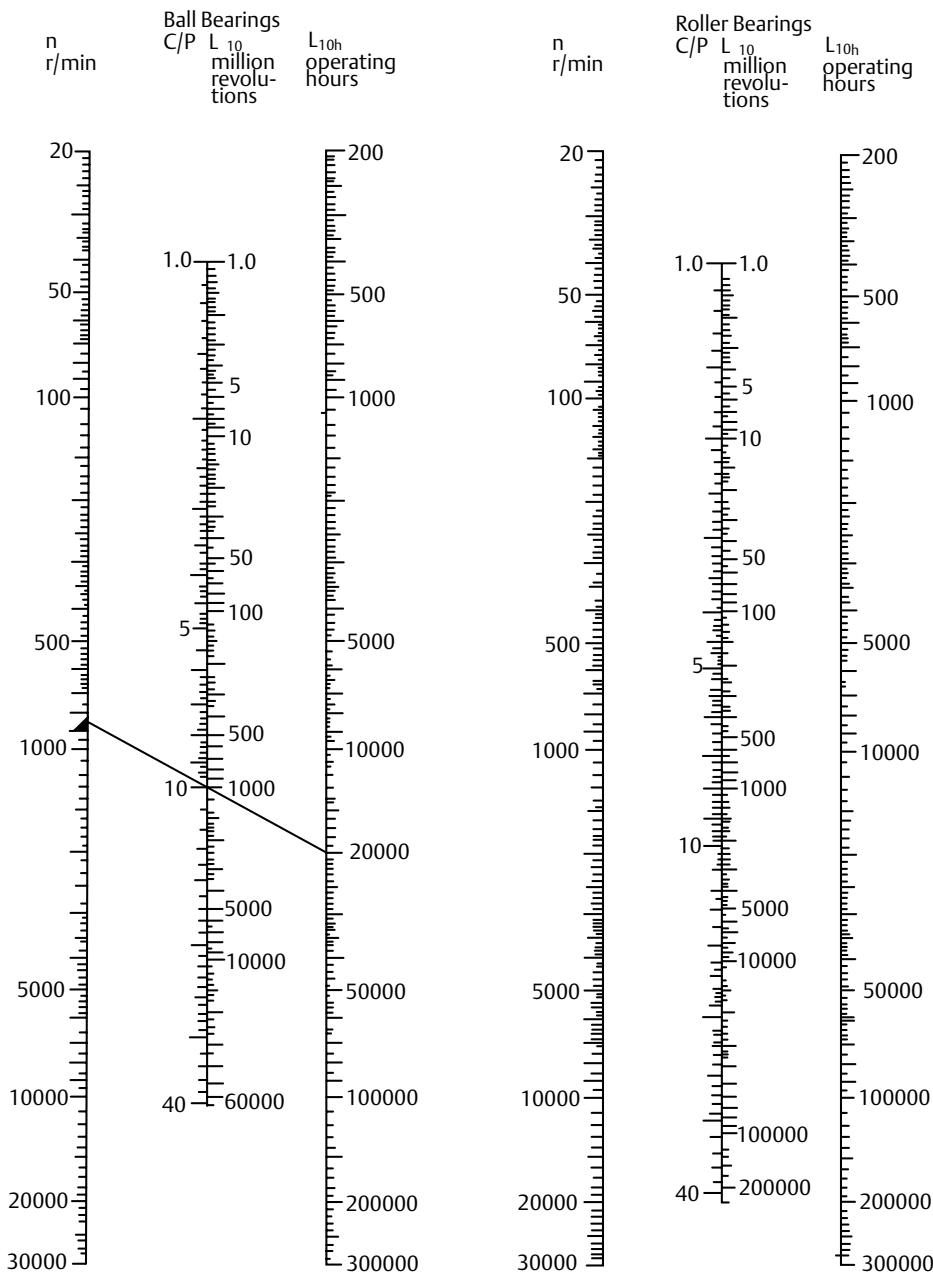

| $L_{10}$ | C / P         |                 |
|----------|---------------|-----------------|
|          | Ball bearings | Roller bearings |
| 0.5      | 0.793         | 0.812           |
| 0.75     | 0.909         | 0.917           |
| 1        | 1.00          | 1.00            |
| 1.5      | 1.14          | 1.13            |
| 2        | 1.26          | 1.24            |
| 3        | 1.44          | 1.39            |
| 4        | 1.59          | 1.52            |
| 5        | 1.71          | 1.62            |
| 6        | 1.82          | 1.71            |
| 8        | 2.00          | 1.87            |
| 10       | 2.15          | 2.00            |

# NOMOGRAM FOR ESTABLISHING NOMINAL LIFE

## Life Calculation Chart

To determine the size of a rolling bearing for a particular field of operation, it is necessary to establish the nominal life corresponding to the field of application.

### Example

A deep groove ball bearing is required to run at speed  $n=850$  RPM under constant radial load of  $f_r = 5$  KN and is to achieve a basic rating life  $L_{10h}$  of 20.000 hours.

From the nomogram using the right hand column ( $L_{10h}$ ), a line drawn from 20.000 to the left hand column ( $n$  RPM) passes through the centre column (C/P L10 10.6) at 10:1000. Therefore, a bearing is required with a basic load rating  $C$  of at least  $C = 10 \times 5$  KN. Reading from the tables relating to deep groove ball bearings, it can be seen that a bearing ref 6309 has a  $C$  value of 52.7 KN. Of course, the choice of bearing is also governed by the shaft and housing parameters.

For motor vehicles and rolling stock, the service life is expressed as a function of the wheel diameter and kilometers traveled as per formulae below:

$$L_{10} = \frac{1000}{\pi D} \cdot L_{10s}$$

or

$$L_{10s} = \frac{\pi D}{1000} L_{10}$$

where:

- L<sub>10</sub> = nominal life in 10<sup>6</sup> RPM  
L<sub>10s</sub> = life in 10<sup>6</sup> kilometers traveled  
D = diameter of wheel in meters. Values for selecting service life in kilometers covered are in table below.

| Vehicle type                                | L <sub>10s</sub> /10 <sup>6</sup> km |
|---|--------------------------------------|
| Wheel bearings for motor vehicles:          |                                      |
| - cars                                      | 0.2                                  |
| - trucks, buses                             | 0.4                                  |
| Axle boxes for rolling stock – freight cars | 0.8                                  |
| Suburban traffic                            | 1.5                                  |
| Long distance coaches                       | 3                                    |
| Rail cars                                   | 3 -1                                 |
| Diesel and electric locomotives             | 3 - 4                                |

Depending on the working temperature of the bearings, their service life is reduced at elevated temperatures.

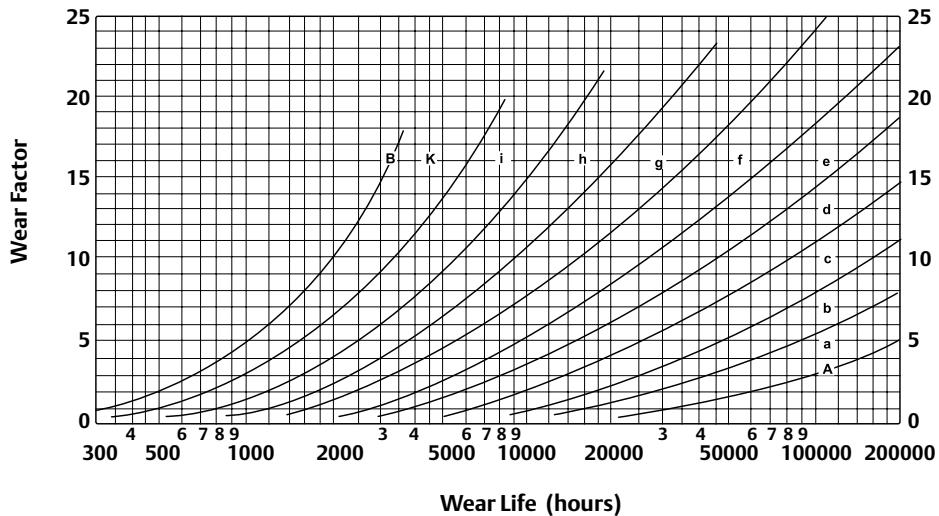

This is to be taken into consideration when the service life is established by the application of temperature factor ft specified in the table below:

|                        |     |      |      |      |
|------------------------|-----|------|------|------|
| Working temperature °C | 150 | 200  | 250  | 300  |
| Working temperature °F | 302 | 392  | 482  | 572  |
| Symbol                 | S0  | S1   | S2   | S3   |
| ft                     | 1   | 0.73 | 0.42 | 0.22 |

In the following table are some recommendations for factor  $f_v$  along with typical applications and life factor  $f_L$ .

| Application  | Fields of operating conditions            | Factor $f_v$                                   | Factor $f_L$  |

The wear life diagram indicates the operating conditions, with the least wear factor at curve A and the heaviest wear occurring at curve B. The area between A and B is subdivided into individual fields from a to k. It can be seen that the operating conditions deteriorate progressively.

## **ADJUSTED RATING LIFE**

Adjustments to life equations

$$L_{10} = \left( \frac{C}{P} \right) p$$

The above formula is adequate for conventional applications, but in exceptional cases other factors must be considered which influence the life of the bearing. To accommodate these factors, the ISO life equation is:

$$L_{\text{na}} = a_1 \cdot a_2 \cdot a_3 \cdot \left( \frac{C}{P} \right) \cdot p$$

or

$$L_{\text{na}} = a_1 \cdot a_2 \cdot a_3 \cdot L_{10}$$

where:

$L_{\text{na}}$  = adjusted rating life in  $10^6$  revolutions the index being the difference between the specified probability life and 100%

$a_1$  = life adjustment factor for reliability

$a_2$  = life adjustment for material

$a_3$  = life adjustment for operating conditions

Calculations for the adjusted rating life are based on the pre-conditions mentioned in the above formulae; for example, that bearing loads can be calculated with accuracy considering all aspects of the loads involved along with shaft deflection etc.

Also, that reliability of the bearing materials are in accordance with the corresponding C values and that normal operating conditions  $a_1=a_2=a_3=1$  and that two life equations become identical.

## **Life Adjustment Factor A1 For Reliability**

The a1 factor is used to determine lives which are obtained or exceeded with a greater probability than 90% (L10). The table below lists the factors for failure probability values between 10% and 1% L10 being the normal rating life.

| Probability % | Failure probability % | Life before fatigue appears | Factor a <sub>1</sub> |
|---------------|-----------------------|-----------------------------|-----------------------|
| 90            | 10                    | L10                         | 1                     |
| 95            | 5                     | L5                          | 0.62                  |
| 95            | 4                     | L4                          | 0.53                  |
| 97            | 3                     | L3                          | 0.44                  |
| 98            | 2                     | L2                          | 0.33                  |
| 99            | 1                     | L1                          | 0.21                  |

## **Life Adjustment Factor A2 For Material**

The factor a2 accounts for the properties of the material and its heat treatment. a2=1 is applicable to the high quality steels used in the production of normal bearing series.

## **Life Adjustment Factor A3 For Operating Conditions**

The operating condition factor a3 is primarily determined by bearing lubrication, providing bearing temperatures are not excessive. For elevated temperatures, see reduction in dynamic load rating in table below.

|                        |     |      |      |      |
|------------------------|-----|------|------|------|
| Working temperature °C | 150 | 200  | 250  | 300  |
| Working temperature °F | 302 | 392  | 482  | 572  |
| Symbol                 | S0  | S1   | S2   | S3   |
| ft                     | 1   | 0.73 | 0.42 | 0.22 |

The efficiency of lubrication is determined primarily by the degree of separation between the rolling elements and raceways. The highest life values are reached when there is a hydrodynamic state of lubrication (where metal to metal contact does not exist between rolling elements and raceway), and under the cleanliness conditions which would normally prevail in an adequately sealed bearing arrangement. The a3 factor is based on the viscosity ratio K – this is defined as the ratio of the actual lubricant viscosity V for the viscosity v<sub>1</sub> required for adequate lubrication. With thinner lubricating films, there is an increase in metal to metal contact and life expectancy decreases.

## Life Adjustment Factor a23

Since a2 and a3 factors are interdependent, the factor combination a23 is used.

$$a_{23} = a_2 \cdot a_3$$

and

$$L_{nA} = a_1 \cdot a_{23} \cdot L [10^6 \text{ revs}]$$

## Service Life

Since the fatigue life modified by the adjustment factors a1, a2, and a3 only considers material fatigue as the cause of failure, the calculated life corresponds to the service life only if the following points are met:

- (a) Lubrication conditions are constant throughout.
- (b) Loads and speeds used for analysis are a true reflection of the actual operating conditions.
- (c) Operating viscosity is based on actual operating temperature.
- (d) Lubricant contamination is limited during the whole running time.
- (e) The service life limited by wear and break down of lubrication is not shorter than the fatigue life.

Wear of the acting surfaces is primarily caused by contamination which, over a period of time, may penetrate the bearing. The situation is made worse by inadequate lubrication and corrosion due to condensation. The amount of wear experienced in a bearing is dependant on the operating conditions, lubrication, and effective sealing arrangement.

## Wear Factor

The permissible amount of wear is expressed by the wear factor  $f_V$ .

$$f_V = \frac{v}{e_O}$$

where:

$v$  = permissible increase in radial clearance (mm)

$e_O$  = bearing constant depending on the bore diameter – see below for

$e_O$  values in relationship with bore diameter mm.

# DEEP GROOVE BALL BEARINGS

## Equivalent Dynamic Load

$$P = XFr + YFa \quad [Kn]$$

The factors X and Y depend upon the ratio Fa/Co. (The relationship of the axial load to the basic static load) the values shown in the table are applicable to bearings mounted with normal fits – shafts machined to j5 or k5 and housings to J6.

## Equivalent Static Load

$$Po = Fr \text{ when } Fa / Fr \leq 0.8 \quad [KN]$$

$$Po = 0.6Fr + 0.5Fa \text{ when } Fa / Fr \pm 8 \text{ KN}$$

Calculation factors X and Y for deep groove ball bearings:

| Fa/Co | Normal radial clearance |   |   |             |     | Radial clearance C3 |   |   |             |      | Radial clearance C |   |   |             |      |
|-------|-------------------------|---|---|-------------|-----|---------------------|---|---|-------------|------|--------------------|---|---|-------------|------|
|       | Fa / Fr ≤ e             |   |   | Fa / Fr > e |     | Fa / Fr ≤ e         |   |   | Fa / Fr > e |      | Fa / Fr ≤ e        |   |   | Fa / Fr > e |      |
|       | e                       | X | Y | X           | Y   | e                   | X | Y | X           | Y    | e                  | X | Y | X           | Y    |
| 0.025 | 0.22                    | 1 | 0 | 0.56        | 1.2 | 0.31                | 1 | 0 | 0.46        | 1.75 | 0.4                | 1 | 0 | 0.44        | 1.12 |
| 0.04  | 0.24                    | 1 | 0 | 0.56        | 1.8 | 0.33                | 1 | 0 | 0.46        | 1.62 | 0.42               | 1 | 0 | 0.44        | 1.36 |
| 0.07  | 0.27                    | 1 | 0 | 0.56        | 1.6 | 0.36                | 1 | 0 | 0.46        | 1.46 | 0.44               | 1 | 0 | 0.44        | 1.27 |
| 0.13  | 0.31                    | 1 | 0 | 0.56        | 1.4 | 0.41                | 1 | 0 | 0.46        | 1.3  | 0.48               | 1 | 0 | 0.44        | 1.16 |
| 0.25  | 0.37                    | 1 | 0 | 0.56        | 1.2 | 0.46                | 1 | 0 | 0.46        | 1.14 | 0.53               | 1 | 0 | 0.44        | 1.05 |
| 0.5   | 0.44                    | 1 | 0 | 0.56        | 1   | 0.54                | 1 | 0 | 0.46        | 1    | 0.56               | 1 | 0 | 0.44        | 1    |

## Axial Loading Capacity

If deep groove ball bearings are axially loaded this should generally not exceed 0.5 Co. For small bearings and light series the axial load should not exceed 0.25 Co.

# DOUBLE ROW SELF-ALIGNING BALL BEARINGS

## Equivalent Dynamic Load

$$P = Fr + Y_1 Fa \quad \text{when } Fa/Fr \leq e$$

$$P = 0.65 Fr + Y_2 Fa \quad \text{when } Fa/Fr > e$$

The values for  $Y_1$ ,  $Y_2$  and  $e$  are given in the bearing tables.

## Equivalent Static Load

$$Po = Fr + Y_0 Fa$$

The  $Y_0$  values are given in the bearing tables.

## Axial Load Capacity When Mounted On Adapter Sleeves

When double row self-aligning ball bearings are mounted on adapter sleeves fitted on smooth shafts, the axial load the bearing will carry depends on the friction between the sleeve bore and the shaft.

The allowable axial load can be calculated by the formula

$$Faz = 3. Bd$$

where:

$Faz$  = maximum allowable axial load (N)

$B$  = bearing width (mm)

$d$  = bore diameter (mm)

# SINGLE ROW ANGULAR CONTACT BALL BEARINGS

## Equivalent Dynamic Load

For single row angular contact ball bearings (series 72B and 73B) with contact angle of 40°, the following relations apply for single and tandem mounted bearings:

$$P = F \quad \text{when: } Fa/Fr \leq 1.14$$

$$P = 0.35 Fr + 0.57 Fa \quad \text{when: } Fa/Fr > 1.14$$

For bearing pairs arranged back to back or face to face:

$$P = Fr + 0.55 Fa \quad \text{when: } Fa/Fr \leq 1.14$$

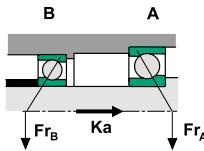

$$P = 0.57 Fr + 0.93 Fa \quad \text{when: } Fa/Fr > 1.14$$

For paired bearings,  $Fr$  and  $Fa$  are the loads acting on the pair.

Since the loads are transmitted from one raceway to the other in an inclined position, radial loads induce axial reaction forces which must be considered when calculating the equivalent dynamic load. For calculation purposes, the equations show where bearing A and bearing B are subjected to a radial load  $Fr_A$  and  $Fr_B$ , respectively, and are always considered positive even when they act in the opposite direction to that shown in the figures. The radial loads act at what is termed the "pressure center" of the bearings, which is given in the bearing tables as dimension "a". There is an external force  $Ka = 0$ ; the equations are valid only if the bearings have been adjusted against each other to practically zero clearance and no preload.

# SINGLE ROW ANGULAR CONTACT BALL BEARINGS

## Bearing Arrangement And Load Equation

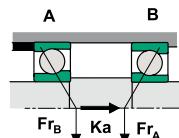

$$1a) F_{rA} \geq F_{rB}$$

$$K_a \geq 0$$

$$FaA = 1.14 FrA$$

$$FaB = FaA + Ka$$

$$1b) F_{rA} < F_{rB}$$

$$K_a > 1.14 (F_{rB} - F_{rA})$$

$$1c) F_{rA} < F_{rB}$$

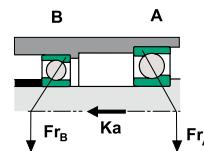

$$K_a < 1.14 (F_{rB} - F_{rA})$$

$$F_{aA} = 1.14 F_{rA}$$

$$F_{aB} = F_{aA} + K_a$$

$$F_{aA} = F_{aB} - K_a$$

$$F_{aB} = 1.14 F_{rB}$$

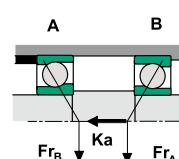

$$2a) F_{rA} \leq F_{rB}$$

$$K_a \geq 0$$

$$F_{aA} = F_{aB} + K_a$$

$$F_{aB} = 1.14 F_{rB}$$

$$2b) F_{rA} > F_{rB}$$

$$K_a \geq 1.14 (F_{rA} - F_{rB})$$

$$2c) F_{rA} > F_{rB}$$

$$K_a < 1.14 (F_{rA} - F_{rB})$$

$$F_{aA} = F_{aB} + K_a$$

$$F_{aB} = 1.14 F_{rB}$$

$$FaA = 1.14 FrA$$

$$FaB = FaA - Ka$$

Note: for double row angular contact ball bearings of 32 and 33 series with one piece inner ring:

$$P = Fr + 0.73 Fa \quad \text{when } Fa/Fr \leq 0.86$$

$$P = 0.62 Fr + 1.17 Fa \quad \text{when } Fa/Fr > 0.86$$

## Equivalent Static Load

For single row angular contact ball bearings of the 72 B and 73 B series, for bearings mounted singly or paired in tandem:

$$Po = 0.5 Fr + 0.26 Fa$$

when  $Po < Fr$   $Po = Fr$  should be used

For bearing pairs arranged back to back or face to face:

$$Po = Fr + 0.52 Fa$$

$Fr$  and  $Fa$  are the loads acting on the pair of bearings.

Note: for double row angular contact ball bearings of 32 and 33 series with one piece inner ring:

$$Po = Fr + 0.63 Fa$$

## Angular Contact Bearings with 15° and 25° Contact Angle (Equivalent load 15° contact angle)

Single bearings and tandem mounted bearings:

$$P = Fr \quad \text{when} \quad \frac{Fa}{Fr} \leq e$$

$$P_o = 0.44 Fr + Y Fa \quad \text{when} \quad \frac{Fa}{Fr} > e$$

The thrust factor Y and values of e are dependant on  $\frac{Fa}{iCo}$  given in tables below.

where:

$Co$  = static load rating [KN]

i = number of bearings

| $\frac{Fa}{i.C_{or}}$ | e    | Y    |
|-----------------------|------|------|
| 0.025                 | 0.4  | 1.42 |
| 0.04                  | 0.42 | 1.36 |
| 0.07                  | 0.44 | 1.27 |
| 0.13                  | 0.48 | 1.16 |
| 0.25                  | 0.53 | 1.05 |
| 0.50                  | 0.56 | 1    |

When paired back-to-back or face-to-face

$$P = Fr + Y Fa \quad \text{when} \quad \frac{Fa}{Fr} \leq e$$

$$P = 0.72 Fr + Y Fa \quad \text{when} \quad \frac{Fa}{Fr} > e$$

The thrust factor Y and values of e are dependant on  $\frac{Fa}{iCo}$  given in table below

where  $Co$  = static load rating of the single bearing KN.

| $\frac{Fa}{C_{or}}$ | e    | $Fa/Fr \leq e$ | $Fa/Fr > e$ |
|---------------------|------|----------------|-------------|
|                     |      | Y              | Y           |
| 0.025               | 0.4  | 1.6            | 2.3         |
| 0.04                | 0.42 | 1.5            | 2.2         |
| 0.07                | 0.44 | 1.4            | 2.1         |
| 0.13                | 0.48 | 1.3            | 1.9         |
| 0.25                | 0.53 | 1.2            | 1.7         |
| 0.50                | 0.56 | 1.1            | 1.6         |

## Equivalent Static Load

*Single bearings and tandem mounted bearings:*

$$P_o = F_r \quad \text{when } \frac{F_a}{F_r} \leq 1.09$$

$$P_o = 0.5 F_r + 0.46 F_a \quad \text{when } \frac{F_a}{F_r} > 1.09$$

*For back to back and face to face arrangements:*

$$P_o = F_r + 0.92 F_a$$

## Equivalent Load 25° Contact Angle

*Single bearings and tandem mounted bearings:*

$$P = F \quad \text{when } \frac{F_a}{F_r} \leq 0.68$$

$$P = 0.41 F_r + 0.87 F_a \quad \text{when } \frac{F_a}{F_r} > 0.68$$

*For back to back and face to face arrangements:*

$$P = F_r + 0.92 F_a \quad \text{when } \frac{F_a}{F_r} \leq 0.68$$

$$P_o = 0.67 F_r + 0.41 F_a \quad \text{when } \frac{F_a}{F_r} > 0.68$$

## Equivalent Static Load

*Single bearings and tandem arranged bearings:*

$$P_o = F_r \quad \text{when } \frac{F_a}{F_r} \leq 1.3$$

$$P_o = 0.5 F_r + 0.38 F_a \quad \text{when } \frac{F_a}{F_r} > 1.3$$

*For back to back and face to face arrangements:*

$$P_o = F_r + 0.76 F_a$$

## CYLINDRICAL ROLLER BEARINGS

The equivalent dynamic radial load of a cylindrical roller bearing subjected to a pure radial load is:

$$P = Fr \text{ [KN]}$$

The equivalent static load of a cylindrical roller bearing subjected to a pure radial load is:

$$Po = Fr \text{ [KN]}$$

The axial dynamic capacity of a roller bearing having ribs on the outer or inner races (types NJ, NUP and HJ) is:

$$F_{az} = \frac{K_1 C_{or} 10^4}{n(d + D)} - K_2 Fr$$

where:

$F_{az}$  = maximum allowable axial load [N]

$C_{or}$  = static radial load [N]

$Fr$  = radial component of loading [N]

$n$  = speed [RPM]

$d$  = inner diameter [mm]

$D$  = outer diameter [mm]

$K_1$  = auxiliary factor, see table

$K_2$  = auxiliary factor, see table

Factor  $K_1$  and  $K_2$

| Lubrication |        |       |
|-------------|--------|-------|
| Factor      | grease | oil   |
| $K_1$       | 10.    | 6     |
| $K_2$       | 0.005  | 0.003 |

The permissible axial load depends on the ability of the roller ends to slide on the surface of the ribs (not fatigue values). It is therefore very important that adequate lubrication is present to assist this and dissipate heat generated by this action. The formula mentioned above is used as a guidance to calculate a suitable axial load along with the "k" factor mentioned in table 2. The formula is based on ideal conditions with (a) maximum temperature differential of up to 60°C (140°F) between ambient and bearing temperature (b) a specific heat elimination of 0.5 mW/mm<sup>2</sup> C (c) viscosity ratio k 1.5.

"k" indicates an effective viscosity ratio  $\nu$  at working temperatures, against  $\nu_1$  viscosity required for a satisfactory lubrication of the bearing.

In case of grease lubrication for  $\nu$  ratio, the basic oil viscosity will be used. If viscosity ratio "K" is smaller than 1.5, friction and wear is generated. These can be reduced at lower speeds by use of oils with EP additives.

The thrust loads  $F_a$  obtained by the formulae are valid for constant axial loadings. For short duration the values can be doubled and may be trebled for shock loads.

For cylindrical roller bearings to function satisfactorily under thrust loads, there must also be radial loads present. The ratio of  $F_a/F_r$  should not exceed 0.4.

The axial loading of bearings has, of course, a certain influence upon their service life. This influence can be practically ignored if the  $F_a/F_r$  ratio is  $\leq 0.2$  in case of bearings in series 10, 2, 3, and 4, and  $F_a/F_r \leq 0.4$  for bearings in series 22 and 23.

In any case of thrust loads which act upon bearings, factor  $F_a$  (N) should not exceed the numerical value of  $1.5 D^2$  ( $D$  = outer diameter of the bearing in mm).

In case of certain high thrust loads ( $F_a \geq D^2$ ), it is recommended to have the ribs of inner and outer rings completely supported by the integral parts of the shaft & housing.

NUP, NJ and HJ type bearings, which take thrust loads from both directions, should always be so arranged that – if the construction of the bearing permits it – main thrust loads are taken by the ribs.

# SPHERICAL ROLLER BEARINGS

## Equivalent Dynamic Load

$$P = Fr + Y_1 Fa \quad \text{when } Fa/Fr \leq e$$

$$P = 0.67 \cdot Fr + Y_2 \cdot Fa \quad \text{when } Fa/Fr > e$$

Values for  $Y_1$ ,  $Y_2$  and  $e$  are given in the bearing tables.

## Equivalent Static Load

$$Po = Fr + Yo Fa$$

Values for  $Yo$  are given in the bearing tables.

## Axial Load Capacity When Mounted On Adapter Sleeves

When spherical roller bearings are mounted on adapter sleeves fitted on smooth shafts, the axial load it will carry depends on the friction between the sleeve bore and the shaft.

*The allowable axial load can be calculated by the formula*

$$Faz = 3 Bd$$

Faz = maximum permissible axial load [N]

B = bearing width mm

d = bearing bore diameter mm

## TAPERED ROLLER BEARINGS

### Equivalent Dynamic Load

$$P = Fr \quad \text{where } Fa/Fr \leq e$$

$$P = 0.4 Fr + YFa \quad \text{where } Fa/Fr > e$$

For paired single row tapered roller bearings:

$$P = Fr + Y_1 Fa \quad \text{where } Fa/Fr \leq e$$

$$P = 0.67 Fr + Y_2 Fa \quad \text{where } Fa/Fr > e$$

For paired bearings  $Fr$  and  $Fa$  are the loads acting on the pair.

Since the loads are transmitted from one raceway to the other in an inclined position, radial loads induce axial reaction forces which must be considered when calculating the equivalent dynamic load. For calculation purposes, the equations show where bearing A and bearing B are subjected to a radial load  $Fr_A$  and  $Fr_B$ , respectively, and are always considered positive even when they act in the opposite direction to that shown in the figures. The radial loads act at what is termed the "pressure center" of the bearings, which is given in the bearing tables as dimension "a". There is an external force  $Ka = 0$ ; the equations are valid only if the bearings have been adjusted against each other to practically zero clearance and no preload.

# TAPERED ROLLER BEARINGS

## Bearing Arrangements And Load Equations

$$1a) \frac{F_{rA}}{Y_A} \geq \frac{F_{rB}}{Y_B}; F_{aA} = \frac{0.5F_{rA}}{Y_A};$$

$$F_{aB} = F_{aA} + K_a \quad K_a \geq 0$$

$$1b) \frac{F_{rA}}{Y_A} < \frac{F_{rB}}{Y_B}; F_{aA} = \frac{0.5F_{rA}}{Y_A};$$

$$F_{aB} = F_{aA} + K_a \quad K_a \geq 0.5 \left( \frac{F_{rB}}{Y_B} - \frac{F_{rA}}{Y_A} \right)$$

$$1c) \frac{F_{rA}}{Y_A} < \frac{F_{rB}}{Y_B}; F_{aA} = F_{aB} - K_a;$$

$$F_{aB} = \frac{0.5F_{rB}}{Y_B} \quad K_a < 0.5 \left( \frac{F_{rB}}{Y_B} - \frac{F_{rA}}{Y_A} \right)$$

$$2a) \frac{F_{rA}}{Y_A} \leq \frac{F_{rB}}{Y_B}; F_{aA} = F_{aB} + K_a;$$

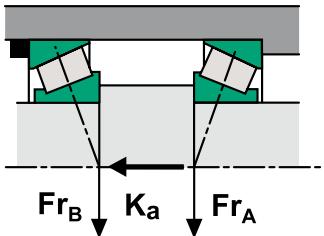

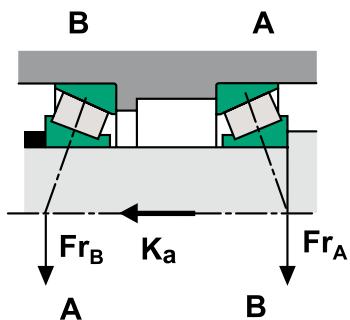

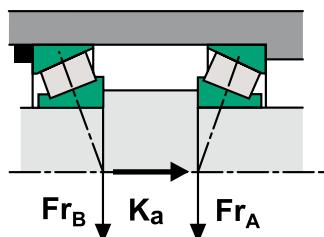

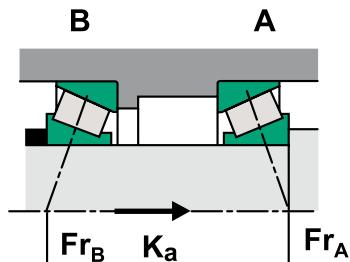

$$F_{aB} = \frac{0.5F_{rB}}{Y_B} \quad K_a \geq 0$$

$$2b) \frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}; F_{aA} = F_{aB} + K_a;$$

$$F_{aB} = \frac{0.5F_{rB}}{Y_B} \quad K_a \geq 0.5 \left( \frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B} \right)$$

$$2c) \frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}; F_{aA} = \frac{0.5F_{rA}}{Y_A};$$

$$F_{aB} = F_{aA} - K_a \quad K_a < 0.5 \left( \frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B} \right)$$

# THRUST BALL BEARINGS

## Equivalent Dynamic Load

$$P = F_a$$

Where  $F_a$  is the axial load (ball thrust bearings can accommodate thrust loads only).

## Equivalent Static

$$P_o = F_a$$

Ball thrust bearings must have a minimum thrust load to function correctly. This ensures that sliding does not occur due to centrifugal forces acting on the ball and cage assembly.

## Minimum Axial Load

This can be calculated from:

$$F_{am} = M \left( \frac{n_{Max}}{1000} \right)^2 [N]$$

where:

$F_{am}$  = minimum thrust load [N]

$M$  = factor for minimum load (see tables)

# SPHERICAL ROLLER THRUST BEARINGS

## Equivalent Dynamic Load

$$P = Fa + 1.2 Fr \quad \text{Providing } Fr \leq 0.55 Fa$$

## Equivalent Static Load

$$P = Fa + 2.7 Fr \quad \text{Providing } Fr \leq 0.55 Fa$$

## Minimum Axial Load

This can be calculated from:

$$F_{am} = \frac{1.25Co}{1000} \text{ [KN]}$$

where:

$F_{am}$  = minimum axial load [KN]

$Fr$  = radial component of load for bearings subjected to combined load [KN]

$Co$  = basic static load [KN]

In many cases, the axial load acting on the bearing produced by the weight of the supporting component parts and external forces is greater than the required minimum load. If this is not the case, then bearings must be preloaded (for example, using springs).

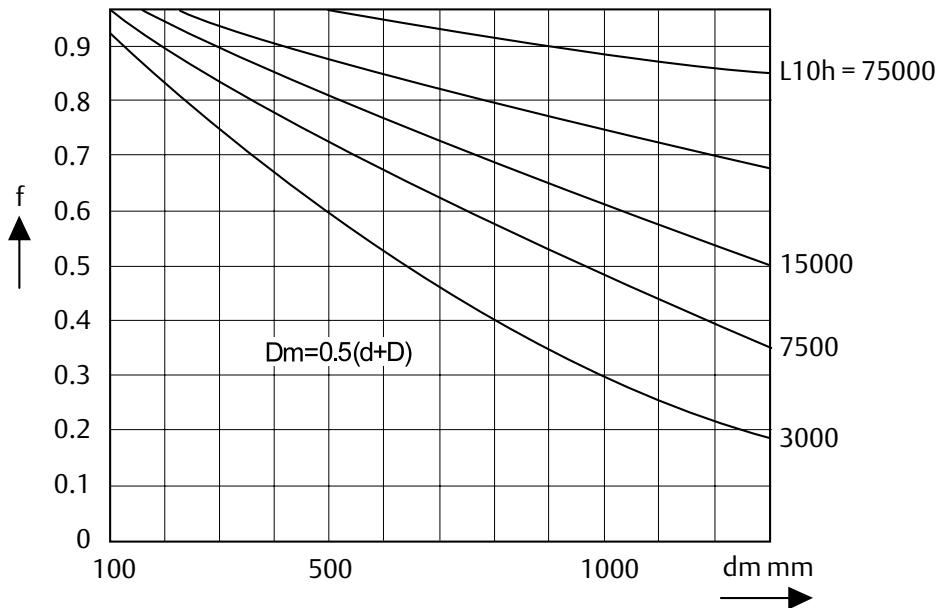

## LIMITING SPEED

The maximum rotational speed of ball and roller bearings depends upon various factors: the size and design of the bearing, type of lubrication (whether grease or oil), and type of cage fitted, along with the internal clearance of the bearing when mounted.

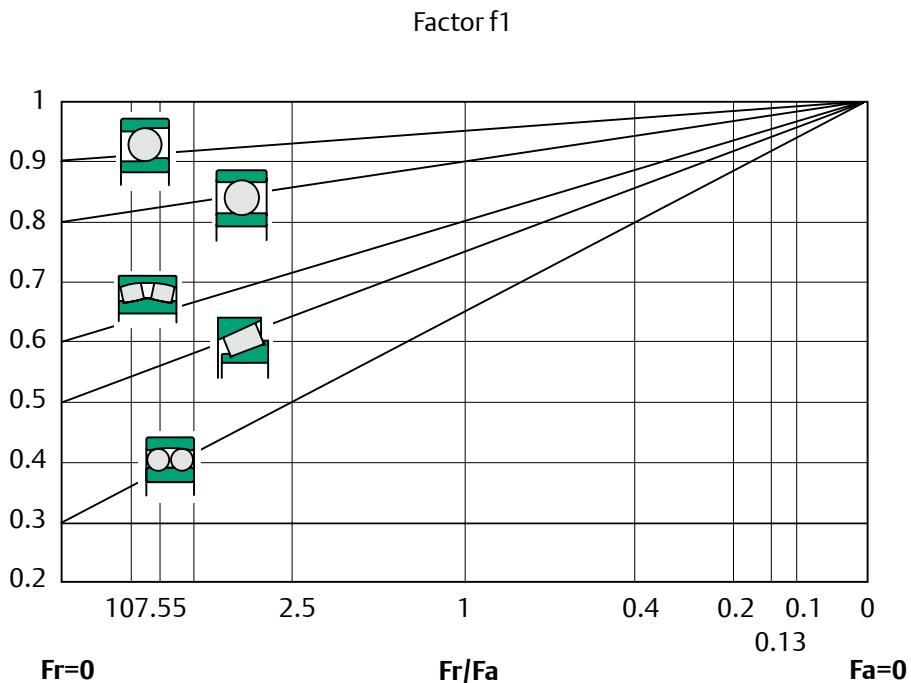

If the radial run-out (which produces out of balance forces) is reduced, then higher speeds can be obtained. Reduction of cage weight will also reduce out of balance forces, such as when made from light alloy or plastic. Cages that are centered on the inner or outer races rather than the rolling elements are used for high speed applications.

With the surface of the riding lips having been specially ground, lubrication between the sliding surfaces must be maintained. Heavier loads influence the speed and also affect the basic rating life of  $L_{10h} \leq 75000$  hours.

In such cases, the speeds listed in the tables should be multiplied by a factor  $f$  which you can obtain from the fig. 1 below.

For combined loads, the speeds indicated in the bearing tables are to be multiplied by the reduction factor  $f_1$  given in diagram fig. 2.

For ball thrust bearings, there must be a minimum load applied to counteract the centrifugal forces of the balls on rotation. Factor M is indicated in the bearing tables against the appropriate bearing size.

# BEARING MATERIALS

## MATERIALS USED IN THE MANUFACTURING OF ROLLER BEARINGS

Bearing rings and rolling elements are subjected to high stresses on a very small contact area, and must have a high resistance to wear as well as high elastic and fatigue limits. Primarily these are manufactured from high-carbon chromium bearing steel with a chemical composition as indicated in table below, and are in accordance with SAE 52100 - 100Cr6.

### HIGH CARBON CHROMIUM BEARING STEEL

| Steel Grade |               | Chemical Composition % |            |            |            |        |        |
|-------------|---------------|------------------------|------------|------------|------------|--------|--------|
|             |               | C                      | Mn         | Si         | Cr         | S      | P      |
| ROL1        | 100 Cr6       | 0.90..1.05             | 0.25..0.40 | 0.15..0.35 | 1.40..1.65 | <0.025 | <0.025 |
|             | 100 CrMnSi6-4 | 0.90..1.05             | 1.00..1.20 | 0.50..0.70 | 1.40..1.60 | 0.020  | <0.025 |
| ROL2 (GMEX) |               | 0.94~1.04              | 0.25~0.45  | 0.15~0.35  | 1.40~1.60  | ≤0.012 | ≤0.020 |

For large bearings that are subjected to high shock loads, carburized low carbon alloy steels are used. Such steels, when carburized to the correct depth, have the added advantage of having a hard surface - and because the core is softer, it is more energy absorbing.

## CAGE MATERIALS

Types of cages for bearings vary in accordance with the operating conditions. The most common are those made from pressed steel. Machined cages are made from high strength copper alloys or carbon steel, and for high speeds manufactured from plastic or phenolic resins.

## HEAT TREATMENT

Bearings are generally used up to a temperature of maximum + 150°C (+302°F). In case of higher temperatures, bearings with special heat treatments should be used. Sealed bearings, 2RS type, should be used at operating temperatures up to +80°C (+176°F). If this temperature is exceeded, the efficacy of lubricants is considerably reduced.

In order to use bearings at a higher operating temperature, the bearings have to be subjected to a special heat treatment. This will ensure the dimensional stability, but will reduce the lifetime by a factor (ft) as per the table below.

|                        |     |      |      |      |
|------------------------|-----|------|------|------|
| Operating temp °C      | 150 | 200  | 250  | 300  |
| Working temperature °F | 302 | 392  | 482  | 572  |
| Symbol                 | S0  | S1   | S2   | S3   |
| ft                     | 1   | 0.73 | 0.42 | 0.22 |

# SUFFIXES AND PREFIXES

## SUPPLEMENTARY DESIGNATION

### Prefixes

- S - Stainless steel components
- K - Stainless steel components
- L - Removable inner or outer ring
- R - Removable bearing with no inner ring
- F - Shaft washer of thrust ball bearing
- W - Housing washer of thrust ball bearing
- WS - Shaft washer of thrust roller bearing
- GS - Housing washer of thrust roller bearing

### Suffixes

Modifications to internal design of bearings.

#### Deep Groove Ball Bearings

- EMQ - Electric motor quality

#### Single Row Angular Contact Ball Bearings

- A - Contact angle of 25°
- B - Contact angle of 40°
- C - Contact angle of 15°

#### Tapered Roller Bearings

- A - Increased loading capacity

#### Cylindrical Roller Bearings

- E - Increased loading capacity
- NA - Non-interchangeable components
- M - Brass cage guided on the rollers
- EM - Increased loading capacity and brass cage guided on the rollers
- EMA - Increased loading capacity and brass cage guided on the outer ring

#### Spherical Roller Thrust Bearing

- EM - Increased loading capacity and new brass cage

## Spherical Roller Bearings

|             |  |
|-------------|--|
| C -         | Pressed steel cage and loose guide ring  |
| CA -        | one piece brass cage, guided on the rollers.<br>Assymetrical roller position   |
| GMEX -      | Improved precision, roundness and surface finish, rings and rollers are manufactured in high grade ROL2 steel, one piece robust brass cage, guided on the rollers. |
| MB -        | 2 piece brass cage , guided on the inner ring  |
| VS C4 F80 - | Special bearing for vibration screen application,d<320   |
| MA C4 F80 - | Special bearing for vibration screen application, d>320  |

## Modifications to external design of bearings

|       |  |
|-------|--|
| X -   | Boundary dimensions altered according to ISO       |
| K -   | Bearings with tapered bore 1:12                    |
| K30 - | Bearings with tapered bore 1:30                    |
| R -   | Flange on outer ring of bearing                    |
| N -   | Snap ring groove on outer ring of bearing          |
| NR -  | Snap ring groove with snap ring                    |
| N2 -  | Diametrically opposed notches on outer ring corner |
| RS -  | Seal on one side of bearing                        |
| 2RS - | Seals on both sides of bearing                     |
| Z -   | Shield on one side of bearing                      |
| ZZ -  | Shields on both sides of bearing                   |
| TM -  | Polyamide cage                                     |

# LUBRICATION

## ROLLING BEARING LUBRICATION

The main duties of introducing lubricants into ball and roller bearings, apart from protecting the finely finished surfaces when rotating at high speeds, is to reduce friction between the rolling elements, the separator or cage, and the races at any point where true rolling is absent. Lubrication also assists in dissipating heat, and sealing the bearing against the entry of contaminants such as dust and moisture.

Rolling bearings may be lubricated with oil or grease. The choice of lubricant is usually decided by temperature, speed, load, and operating conditions along with bearing design. We summarise as follows:

1. The size of bearing governs the viscosity of the lubricant – the larger the bearing the higher should be the viscosity. Regarding size, rolling bearings can be divided into four sizes depending on the outside diameter:

|                     |                                 |
|---------------------|---------------------------------|
| Very small bearings | $D \leq 22 \text{ mm}$          |
| Small bearings      | $D \leq 62 \text{ mm}$          |
| Medium bearings     | $62 \leq D \leq 240 \text{ mm}$ |
| Large bearings      | $D \geq 240 \text{ mm}$         |

2. Speed has an influence upon the viscosity of the lubricant because the resisting force, opposed to the moving parts by the lubricant, depends on its viscosity. The higher the revolution speed, the lower the viscosity of the lubricant should be.

The revolution speed may be:

Normal  $n \leq 75\%$  of the limit speed specified in the tables

High  $75\% \leq 100\%$  of the limit speed specified in the tables

Very high  $n \geq 100\%$  of the limit speed specified in the tables. For very high revolution speeds, oil lubrication is required to transfer frictional heat or other sources of heat away from the bearing.

3. Equivalent loading capacity,  $P = XFr + YFa$ , conditions the viscosity grade of the lubricant, due to specific pressure which appears between the contact surfaces. The higher this is, the greater the resistance of the lubricant film should be, and the respective viscosity.

Loads may vary as follows:

*normal loads where*

$P/Cr \leq 0.1$  for bearings within diameter ranges 1, 2 and 3.

$P/Cr \leq 0.15$  for bearings within diameter range 4.

*high loads where*

$P/Cr \geq 0.1$  for bearings within diameter ranges 1, 2 and 3.

$P/Cr \geq 0.15$  for bearings within diameter range 4.

$P$  = equivalent dynamic load [KN]

$Cr$  = basic dynamic load [KN]

4. The operating temperature affects selection of lubricants, as it is an influence upon viscosity. Therefore, each lubricant is used only within the limits of certain clearly defined temperature ranges.

## **GREASE LUBRICATION**

Although oil is the better lubricant, grease is often preferred because of the following natural advantages:

- Grease helps to form an effective closure between the shaft and housing, thus preventing the ingress of dirt, moisture and other corrosive agents.
- Grease protects the finely finished working surfaces of a bearing by clinging to them, particularly when the bearing is not in motion. Oil tends to drain away, leaving the surfaces open to attack.
- Grease is easier to retain within the housing than oil. This is of great help in the food, printing, textile, chemical and other industries where contamination or staining can ruin the product.
- Grease is convenient to handle, and re-lubrication of bearings is quick and clean. Planned lubrication cycles are often possible, resulting in smaller labour costs.

Whatever type of grease is used, it should have no tendency to separate under operating conditions. When separation occurs, the oil runs out of the bearing and leaves behind dry soap, which hardens and cakes. This interferes with the movement of the rolling element, which may result in overheating and mechanical failure. Excessive softening is also undesirable, because the grease might then leak out of the bearing and leave working surfaces unprotected.

The quantity of grease used for the lubrication of a rolling bearing should not be too great, as a tightly packed bearing is liable to overheat if operated at high speed. Relubrication intervals depend on the bearing type, inner diameter and revolution speed for filling with fresh grease. The quantity required is given in the following equation:

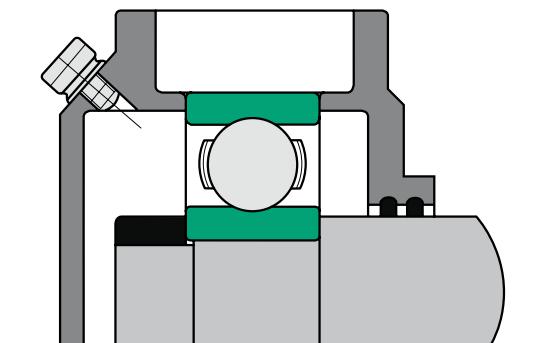

$$G = 0.005 DB \text{ grams}$$

where:

D = outer diameter (m/m)

B = width (m/m)

After a certain number of refills, it is necessary to remove old grease completely using a suitable solvent. Never mix two grades of grease.

**Typical Grease Lubrication**

## OIL LUBRICATION

Oil is sometimes more convenient to use than grease, and there are circumstances when it is definitely preferred. These are as follows:

- When frictional resistance in light machinery and instruments must be kept low.
- Where either the speed or the temperature is too high for grease lubrication.
- Where high temperature and heavy load occur together, with or without high speed.
- Where the bearings are enclosed in a casing that contains other components lubricated by oil, e.g. a gearbox.

A good quality mineral oil should be used of a viscosity to suit the operating conditions involved. Vegetable or animal oils are not recommended as these can become rancid under certain conditions and cause corrosion problems. A small supply of oil is required to lubricate the bearings; a more copious supply should be used if the bearing must be kept cool, when it is often advantageous to use a synthetic oil to cope with the temperature conditions.

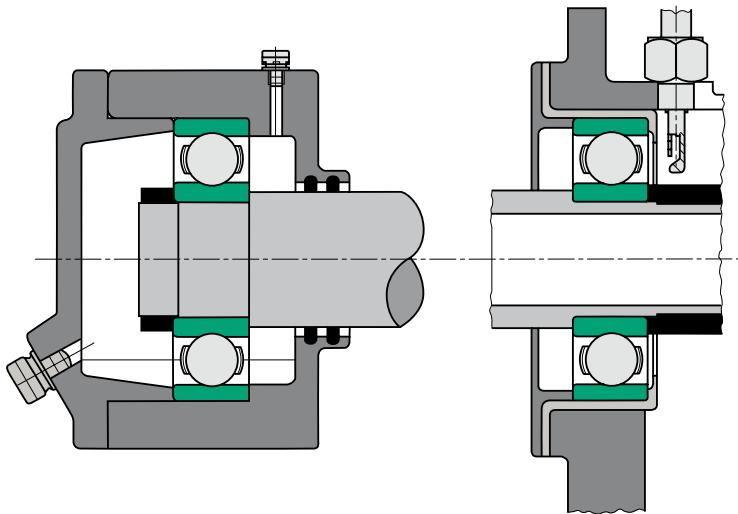

Limiting temperature for mineral oil is about 150°C (302°F) and for synthetic oils about 220°C (428°F).

## METHODS OF OIL LUBRICATION

Methods of oil lubrication for rolling bearings include oil bath, oil circulation, oil splash and oil mist.

### Oil Bath

This method is suitable for horizontal shaft applications. The oil should reach the center of the bottom ball or roller in the bearing; a greater depth than this could cause overheating due to churning of the oil. The surface area and volume of the oil in the bath should be sufficiently large to maintain an adequate depth of oil for the cage to dip into when running. Sight oil level indicators can be used. Alternatively, a tapped and plugged hole can be provided at the correct level; when replenishing the oil, the plug is removed and oil added until it starts to escape through the hole. The plug should, of course, be replaced before the machine is started!

**Oil Bath**

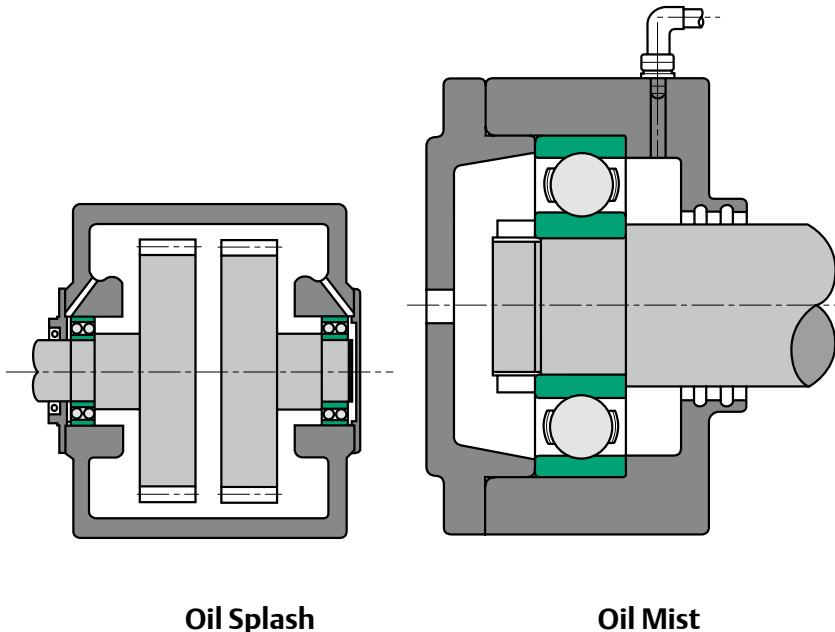

**Pump feed**

### Pump-Feed Lubrication

This is especially suitable for heavily loaded, high-speed bearings, since such conditions can result in bearing temperatures well in excess of 100°C (212°F). Oil is pump-fed to each bearing, being directed by jets on to the outside diameter of the inner ring so that some of it gains access to the internal parts of the bearing. Each bearing may require from 45 to 140 litres of oil per hour, although most of this only flushes the face of the bearing to keep it cool. A reservoir is often provided to lubricate the bearing during starting: alternatively, the pump can be started before the machine is set in motion so that the bearing never runs unlubricated.

## Splash Lubrication

This is suitable when the bearings are enclosed in a casing, such as a gearbox, and the oil used to lubricate the gears is distributed sufficiently to lubricate the bearings. The oil is either splashed directly on to the bearings or collected in galleries and directed to the bearings. The drawing below illustrates how the oil is made to pass through the bearing before it returns to the gearbox casing.

## Oil Mist System

One important advantage of this method of lubrication is that only a small quantity of oil is required, carried in a stream of compressed air. The oil mist equipment should be turned on before the machine is set in motion so as to ensure that the bearings are constantly covered by a thin film of oil when rotating.

Oil mist is advantageous for applications such as machine tools (where it can also be used to lubricate slideways, gears, chains and other components), since the air escaping from the bearing housing prevents the ingress of foreign matter. The flow of air also keeps the bearing cool. It is important that the compressed air used is absolutely clean and dry.

# HANDLING OF BEARINGS

## Care & fitting of bearings

### Storage

1. Store ball and roller bearings in a clean, dry place in their original wrappings. This will preserve them from deterioration.
2. Use older stock first.
3. Do not stack too many large bearings on top of each other. This can cause the protective oil to be squeezed out from between the bearing and its wrapping, thus leading to corrosion problems. Also, never store large bearings upright, but lay them flat.

### Fitting

4. Absolute cleanliness is essential when handing bearings. They should not be removed from their wrappings until required for fitting. A smooth, metal-topped bench that can be wiped clean is a great advantage. All tools, shafts, housings and other components must be perfectly clean. If fitting operations are delayed or interrupted, the assembly should be wrapped with greaseproof paper to exclude dirt and dust.
5. Bearings are usually coated with a rust-preventative oil, unless pre-lubricated and/or packed to suit individual requirements. There is no need to remove this oil unless:
  - It is sufficient to cause serious dilution of the oil or grease used in the bearing. This normally applies to smaller bearings where the rust-preventative oil represents a large proportion of the required amount of lubricant.
  - Low torque is required.
  - A synthetic lubricant is used that may not be compatible with the protecting oil.

To remove the rust preventive oil, wash the bearing in a good quality cleaning fluid. Allow the bearings to drain thoroughly and dry them. The following are satisfactory methods for drying:

- Place the bearing in an oven or on a hot plate with a temperature of 65-80°C (149-176°F).
- Direct dry, clean, compressed air on to the bearings. The cage and rings of smaller bearings must be held firmly. A sudden blast of air can rapidly accelerate the free bearing parts, causing the balls to skid and damaging the highly finished internal surfaces of the bearing.

6. The fitting of the rings on their seatings are very important. Therefore, ensure that the shaft and housing seatings are of correct size and of good shape.
7. All shoulders must be smooth and square with the axis of rotation.
8. Never drive one ring on to its seating by blows on the other. Such blows cause damage to the balls or rollers and raceways.
9. Apply pressure evenly around the rings. A press is better than a hammer.
10. Should a hammer be used, a mild steel or brass tube of suitable size should be interposed between it and the bearing. This will distribute the force of the taps, which should be given progressively around the ring.
11. When the inner ring, outer ring and rollers of a separable roller bearing are brought together, they must be properly in alignment with each other. When not aligned, the rollers are unable to slide freely, and force would need to be used to bring the parts together. Such force would result in the rollers and raceways becoming scored. This, in addition to causing noisy running, can cause early failure of the bearing.
12. Where the ring of a bearing is to be against an abutment, make sure it is properly seated.
13. For heavy interference fits, inner rings may be shrunk onto their seatings after heating in clean mineral oil at a temperature of approximately 100%. Confirm that the bearing is in contact with the abutment shoulder after it has cooled.
14. In the case of taper clamping sleeve and nut bearings, the clamping nut must not be over-tightened. This can expand the inner ring and eliminate all clearance within the bearing, or even fracture the inner ring.

It is recommended that when using pin spanners, they have a length of approximately five times the shaft diameter. After the nut has been tightened as much as possible by hand pressure, one or two light hammer blows should be given to the handle of the spanner; this should tighten the nut sufficiently. It is good practice, if possible, to check that the sleeve is still clamped firmly to the shaft after a few days running.

As an additional precaution it is recommended that, whenever possible, the bearings are fitted so that the rotation of the shaft tends to tighten the nut on the sleeve.

When using torque spanners, it is recommended that the following torques be applied to the clamping nut:

*For LIGHT series bearings:*

| <b>Shaft Diameter</b> | <b>Torque on Nut</b>     |
|-----------------------|--------------------------|
| 1" and 25m/m          | 7.6 Kgm/M (55 lbs ft)    |
| 1½" and 40 m/m        | 12.4 Kgm/M (90 lbs ft)   |
| 2" and 50 m/m         | 17.25 Kgm/M (125 lbs ft) |
| 3" and 75 m/m         | 30.3 Kgm/m (220 lbs ft)  |

For MEDIUM series bearings, increase the above figures by approximately 50 percent.

## **Dismantling And Replacement**

15. Unnecessary removal of a bearing should be avoided, particularly where interference fits have been used. Removal can damage a bearing and, in some instances, cause deterioration of the interference fit. Very often it is sufficient to clean and relubricate the bearing in its fitted position.  
Only remove a bearing if you need to inspect it closely. Symptoms that may require close inspection are the condition of the lubricant, the bearing temperature and noise level.
16. Sometimes a ball locating bearing is installed with roller journal bearings. This may be only push fit on the shaft, and therefore easily dismantled.
17. In certain applications, some form of extractor may be necessary. This must act directly on the ring to be removed. Never try to remove the inner ring by applying force to the outer ring, or vice versa.
18. Thrust bearings are usually installed with push fits, and should offer no difficulty. Take care to keep the rings aligned, however, to prevent them from binding.

19. Carefully protect bearings from dirt and moisture while they are out of their housings. It is advisable to wash them thoroughly immediately after removal, using the following procedure:
  - Immerse in a washing fluid, such as clean white spirit or good-quality paraffin. The washing fluid must not attack the bearing components. After soaking, move each separate bearing around in the fluid, using a basket or other container if convenient. Occasional slow oscillations of the bearing rings will help to dislodge dried out grease and other matter.
  - When clean, thoroughly drain and dry.
  - Lubricate the bearing immediately and re-fit. Alternatively, completely coat all parts with a rust preventative oil, working it well into the internal parts of the bearing. Then wrap the bearing in greaseproof paper and box until required for re-fitting, when the bearing will require re-lubricating.
20. Worn shafts, housings and abutments must have attention if creep has occurred. Do not resort to knurling, scoring, or distortion of the seating on which creep has occurred in order to simulate an interference fit. Such deceptive practices are ineffective, and creep will quickly return. In addition, even if the ring is prevented from creeping it will usually be distorted by the seating, resulting in bearing failure due to local overloading of the raceways and of the balls or rollers.

# FITS AND CLEARANCES

## RADIAL INTERNAL CLEARANCE

Radial clearance is the total internal clearance between the balls or rollers in a bearing and their raceways, measured normal to the axis of the bearing. This clearance compensates for:

- expansion of the inner ring and/or contraction of the outer ring when interference fits are used
- for differential expansion of the two ring when the inner ring of a bearing operates at a higher temperature than the outer ring
- affects the end play of ball bearings and also affects their capacity for carrying axial loads – the greater the radial clearance, the greater the capacity for supporting axial load.

When bearings with small radial clearances are used, special attention must be given to the selection of seating dimensions.

Once ball and roller bearings are mounted and running, a small amount of radial or running clearance is normally desirable. In the case of bearings under radial load, quieter running is generally obtained when this clearance is at minimum.

*Radial clearance figures for ball and roller bearings mentioned in our tables are in accordance with I.S.O. recommendations.*

For normal applications, the general guide given in Table 1 below may be used. Excessive radial tightness in the bearing should be avoided under all conditions.

**Table 1 – Summarizing The Correct Radial Clearance**

| Radial clearance of bearing | Fit of races on seating                 | Possibility of temperature changes reducing radial clearance |
|-----------------------------|---|--|
| C2                          | No appreciable interference either race | absent   |
| CN                          | One race only interference fit          | absent   |
| C3                          | One race only interference fit          | present  |
| C3                          | Both races interference fit             | absent   |
| C4                          | Both races interference fit             | present  |

**C2 fit** These bearings have the smallest amounts of radial clearance. They should only be used where freedom from all play is required in the assembled bearing, and there is no possibility of the initial radial clearances being eliminated by external causes. Therefore, special attention must be given to the seating dimensions, as the expansion of the inner ring or contraction of the outer ring may cause tight bearings.

**CN fit** This grade of radial clearance is intended for use where only one ring is made interference fit, and there is no appreciable loss of clearance due to temperature differences. Ball and roller bearings for general engineering applications are usually of this clearance.

**C3 fit** This grade of radial clearance should be used when both rings of a bearing are made an interference fit, or when only one ring is an interference fit but there is likely to be some loss of clearance due to temperature differences. It is the grade normally employed for roller journal bearings on general engineering applications, especially where there is a tendency for “creep” to take place due to out-of-balance loading.

It is also the grade normally used for ball bearings that take axial loading, but for some purposes even “C4” fit bearings may be required.

**C4 fit** This is the grade of radial clearance to adopt when there will be some loss of clearance due to temperature differences and both races must be an interference fit. One example of its use is in bearings for traction motors.

Where seating limits give an interference fit tighter than the recommended figures, or where temperature differences could cause radial tightness, the correct clearance can be established by calculating the maximum loss of clearance at both extremes of the following basis. A suitable clearance grade from the tables can then be selected.

Total lost of clearance = RI + RO + RT + RM

**RI** = Expansion of inner ring raceway due to shaft interference. (See table below).

**RO** = Contraction of outer ring raceway due to housing interference. (See table below).

**RT** = Loss of clearance due to the inner ring being at a higher temperature than the outer ring.

**RM** = Loss of clearance due to increase in seating interference, resulting from nonferrous seating expanding or contracting at different rates from bearing steel.

Table 2 below gives approximate values for RO and RI assuming a solid shaft and substantial housing.

**Table 2**

| Bearing series   | Inner ring raceway expansion RI | Outer ring raceway Contraction RO |
|------------------|---------------------------------|-----------------------------------|
| Extra light      | 100% interference               | 80% interference                  |
| Light            | 80% interference                | 60% interference                  |
| Medium and heavy | 70% interference                | 50% interference                  |

## FITS

Tolerances for the boundary dimensions of bearings are to ISO standards. To ensure satisfactory performance of the bearing under variable operating conditions, it is necessary to select suitable fits between the inner ring and the shaft and the outer ring and the housing.

When selecting the correct fits from the ISO range of shaft and housing tolerances, it is necessary to consider adequate radial support of the bearing, ease of mounting and dismounting, and allowance for axial movement of the free bearing.

Selection of the fit also depends on the loading on the bearing and on the operating temperature. It should be noted that tight fits reduce the internal clearance of the bearing, and allowance should be made when selecting the bearing clearance.

## TOLERANCES

The boundary dimensions and tolerances of rolling bearings have been standardized by ISO. Bearings are manufactured to normal class 0 tolerances, unless otherwise stated.

Tolerances are also listed for the closer-than-normal limits required, for example, in machine tool and high speed applications.

The more common ISO norms referred to are as follows:

- |                 |   |
|-----------------|---|
| ISO 15-2008 –   | Rolling bearings – Radial bearings – Boundary dimensions        |
| ISO 104-2002 –  | Thrust bearings with flat housing washers – Boundary dimensions |
| ISO 199-2005 –  | Rolling bearings – Thrust ball bearings – Tolerances            |
| ISO 355-2007 –  | Metric tapered roller bearing - Boundary dimensions             |
| ISO 464-2002 –  | Rolling bearings with locating snap ring – Dimensions           |
| ISO 492-2002 –  | Radial bearings – Tolerances                                    |
| ISO 1132-2001 – | Rolling bearings – Tolerances – Definitions                     |
| ISO 5753-2009 – | Rolling bearings – Radial internal clearances                   |

# ROLLING BEARING TOLERANCE SYMBOLS

## Bore Diameter

- d - Nominal bore diameter
- d<sub>1</sub> - Nominal large diameter of tapered bore
- d<sub>s</sub> - Single bore diameter
- Δd<sub>s</sub> - Deviation of a single bore diameter
- √d<sub>s</sub> - Bore diameter variation
- D<sub>m</sub> - Mean bore diameter
- ΔD<sub>m</sub> - Mean bore diameter deviation
- D<sub>mp</sub> - Single plane mean bore diameter
- ΔD<sub>mp</sub> - Single plane mean bore diameter deviation
- Δd<sub>1mp</sub> - Deviation of mean large diameter from nominal-tapered bore
- V<sub>DP</sub> - Bore diameter variation in a single radial plane
- V<sub>DMP</sub> - Mean bore diameter variation
- α - Taper angle

## Outside Diameter

- D - Nominal outside diameter
- D<sub>s</sub> - Single outside diameter
- √D<sub>s</sub> - Deviation of a single outside diameter
- D<sub>m</sub> - Mean outside diameter
- ΔD<sub>m</sub> - Mean outside diameter deviation
- D<sub>mp</sub> - Single plane mean outside diameter
- ΔD<sub>mp</sub> - Single plane outside diameter deviation
- V<sub>DP</sub> - Outside diameter variation in a single radial plane
- V<sub>DMP</sub> - Mean outside diameter variation

## **Width And Height**

- B - Nominal inner ring width
- V - Nominal outer ring width
- Bs - Single inner ring width
- Cs - Single outer ring width
- $\Delta Bs$  - Deviation of a single inner ring width
- $\Delta Cs$  - Deviation of a single outer ring width
- $\sqrt{Bs}$  - inner ring width variation
- $\sqrt{Cs}$  - Outer ring width variation
- Bm - Mean inner ring width

## **Radial Run Out**

- Kla - Radial run out of assembled bearing inner ring
- Kea - Radial run out of assembled bearing outer ring
- Sd - Face run out with bore
- SD - Variation of outside surface inclination with face
- Sla - Assembled bearing inner ring face run out with raceway
- Sea - Assembled bearing outer ring face run out with raceway
  
- D1 - Nominal diameter of outer ring flange
- T - Nominal width of tapered roller bearing
- $\Delta Ts$  - Deviation in width of tapered roller bearing at single position
- T1 - Nominal width of tapered roller bearing-cone
- $\Delta T1s$  - Deviation of width of tapered roller bearing-cone
- T2 - Nominal width of tapered roller bearing-cup
- $\Delta T2s$  - Deviation of width of tapered roller bearing-cup
  
- d2 - Nominal shaft washer diameter – double acting thrust bearing
- $\Delta d2p$  - Deviation of shaft washer mean bore diameter single plane
  
- Dw - Nominal diameter of roller
- Dwm - Mean diameter of roller
- Lw - Nominal length of roller

## Precision Class P6X

- The limit tolerances for the diameter and the radial run-out of the outer ring and the inner ring in this precision class are the same with precision class P0.
- The limit tolerance for the width and mounting height for the outer and inner ring are those indicated below.

Tolerances in  $\mu\text{m}$

| D<br>mm |       | $\Delta Bs$ |       | $\Delta Cs$ |       | $\Delta Ts$ |       | $\Delta T1s$ |       | $\Delta T2s$ |       |
|---------|-------|-------------|-------|-------------|-------|-------------|-------|--------------|-------|--------------|-------|

Dimensions  $D_2$  and  $g$  refer to the snap ring fitted in to the bearing groove  $D_3$   
 $D_3$  represents the nominal inner diameter of the snap ring before mounting

## **ABUTMENT RECOMMENDATIONS**

### **Fillet Radii**

The bearing tables give the maximum fillet radius which the bearing will clear.

A fillet radius which is too large can cause distortion of the bearing ring, and may cause misalignment of the bearing relative to the seating.

### **Abutment Shoulders**

These must be flat, aligned with the axis of rotation, and free from burrs, to maintain bearing alignment and give proper support to the bearing faces.

### **Minimum Abutment Diameter**

Minimum abutment diameters for bearings not subject to significant axial load are:

$$\text{Inner ring abutment} = d + 4r \text{ (minimum)}$$

$$\text{Outer ring abutment} = D - 4r \text{ (minimum)}$$

where:

$d$  = bearing bore diameter

$r$  = fillet radius (from bearing tables)

$D$  = bearing outside diameter

### **Maximum Abutment Diameters**

The normal recommendations concerning maximum abutments for radial ball and standard cylindrical roller bearings are given in tables.

It may not always be possible for small bearings to satisfy the minimum abutment recommendations, and in such cases the abutment should be made to the maximum figure in the table.

### **Abutments For Thrust Bearings**

Thrust bearing abutments must be accurately machined flat and aligned with the axis of rotation, as any misalignment will induce creep. The thrust bearing washers should be supported beyond the pitch diameter of the ball assembly. This may be calculated as:

$$Pcd = (d+D)/2$$

where:

$d$  = small bore diameter

$D$  = large outside diameter

## Maximum Abutments, Metric Sizes

# SINGLE ROW DEEP GROOVE BALL BEARINGS

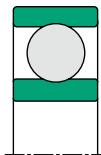

## Dimensions in accordance with ISO 15-2008

The single row deep groove ball bearing is the most popular type of rolling bearing. Because the inner and outer raceway radii are only slightly larger than the ball diameter, it has considerable axial load carrying capacity in either direction, as well as radial loading. They are suitable for high speeds, and can be supplied with shields or seals - for example, Suffix ZZ is added for shielded type, and suffix 2RS is added for sealed type. The shielded type have a running clearance between the inner-race and the metal shield, whereas the seals (made from synthetic rubber), make contact with the inner race. Both shielded and sealed bearings are supplied with the correct amount of lithium base grease, which has an operating temperature of -30 to +120°C (-22°F + 248°F).

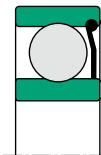

Cages are normally two pieced pressed steel. For higher speeds, machined brass cages and reinforced plastics are used. Plastic cages are limited on operating temperature to about 120°C (248°F) maximum.

Deep groove ball bearings can also be supplied with snap ring and groove, which provide a simple and space-saving means of locating the bearing in the housing. Bearings with this feature have the suffix NR added to the designation.

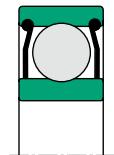

Bearings with the EMQ suffix are specifically for electric motors. These bearings are manufactured specifically to reduce vibration and noise level.

# SELF-ALIGNING BALL BEARINGS

## Dimensions in accordance with ISO 15-2008

Self aligning ball bearings have two rows of balls, located on the inner ring and a spherical outer track. This design permits misalignment of the inner and outer races caused, for example, by shaft deflection or variation in housing alignment.

These bearings are also manufactured with tapered bore for use with adapter sleeves.

## Misalignment

Maximum permitted misalignment in degrees.

| Bearing series          | Maximum inclination in degrees |
|-------------------------|--------------------------------|
| 108, 126, 127, 129, 135 | 3°                             |
| Series 12               | 2.5°                           |
| Series 13               | 3°                             |
| Series 22               | 2.5°                           |
| Series 22-2RS           | 1.5°                           |
| Series 23               | 3°                             |
| Series 23-2RS           | 1.5°                           |

# ANGULAR CONTACT BEARINGS

## Dimensions in accordance with ISO 15-2008

Single row angular contact ball bearings are designed especially to carry combination radial and single direction thrust loads. To carry thrust loads from opposing directions, these bearings are frequently mounted in duplex pairs with the contact angles opposed. Angular contact bearings can be mounted in a variety of ways, for example "face to face" and "tandem", as illustrated below.

Bearings are also available with universally flush ground side surfaces of the inner and outer rings for duplex mountings. Flush ground bearings are available in different preloads to give axial rigidity. Angular contact bearings are offered in extra light, light, and medium series. Each series is available in 15, 25, and 40 contact angles to fulfill a wide variety of applications. A higher contact angle increases thrust capacity and axial rigidity, but reduces radial capacity and radial rigidity. Pressed steel, machined bronze, and phenolic cages are available to meet a variety of speed and duty requirements.

## SINGLE ROW ANGULAR CONTACT BALL BEARINGS

Series 72 B, 73 B  
Contact angle

$$\alpha = 40^\circ$$

Series 70 A, 72 A  
Contact angle

$$\alpha = 25^\circ$$

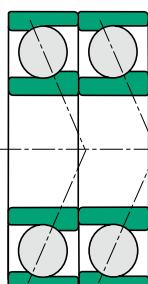

Series 70 C, 72 C  
Contact angle

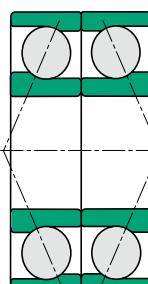

$$\alpha = 15^\circ$$

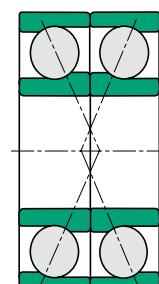

DT arrangement  
(tandem)

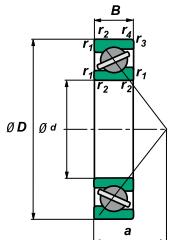

DB arrangement  
(back to back)

DF arrangement  
(face to face)

# CYLINDRICAL ROLLER BEARINGS

## Dimensions in accordance with ISO 15-2008

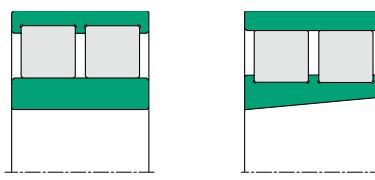

Cylindrical roller bearings are manufactured in a number of designs as indicated on the following page, the predominant type being the single row roller. The roller and cage assembly are guided axially by the integral flanges (ribs) on one of the bearing rings. This design facilitates ease of mounting and dismounting, particularly where both races are an interference fit on their seatings. Roller bearings with flanges (ribs) on one race only do not provide any end location. Various roller bearings with ribs on both races provide axial location, and are capable of carrying light or intermittent axial loading. These patterns are of the NJ, NUP and NJ+HJ types. If used for axial location and light axial loads, the contact between the flanges (ribs) and the roller ends is that of a sliding bearing, not rolling bearing; therefore lubrication is of paramount importance.

Alignment is much more critical than that of a ball bearing; as a general guide, this is limited to approximately .003 radians.

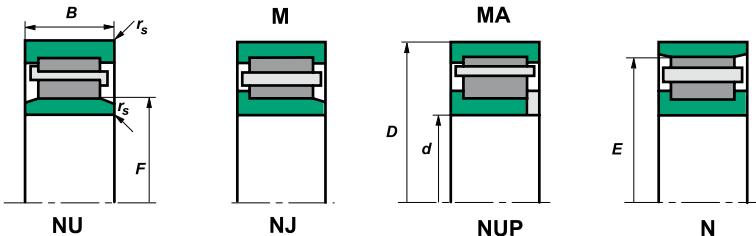

Double and multi-row bearings are also manufactured - see NN and NNU series.

Of these bearings, the NJ, NUP and NJH types can also carry light or intermittent thrust loads between the guide rib and the end of the rollers. Several arrangements of locating ribs are available, as illustrated. The choice between these types is usually decided by consideration of assembly procedure or machine clearances. The bearings utilizing machined bronze cages are suitable for high speed operation. The NN 30 and NN 30 K series are available in high precision tolerances and, due to their extreme rigidity, are particularly suited for use in machine tool spindles.

# SPHERICAL ROLLER BEARINGS

## Dimensions in accordance with ISO 15-2008

Spherical roller bearings are designed to sustain heavy loads, shaft misalignment and deflection. They contain two symmetrical or asymmetrical rows of barrel-shaped rollers, which align themselves in the outer race spheroid track. They are, therefore, able to carry very heavy radial loads and axial loads in either direction.

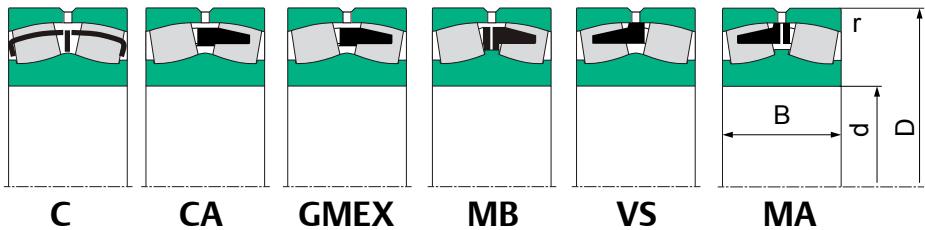

Roller guidance is achieved by the fixed flanges on the inner ring for the CA, GMEX, MB, VS and MA - design or a floating ring for the C design. For further information, see roller guidance design on next page.

## Misalignment

The table below gives figures for permitted misalignment in the different bearing series.

| Bearings series | Angular misalignment degrees |
|-----------------|------------------------------|
| 213             | 1°                           |
| 222             | 1.5°                         |
| 223             | 2°                           |
| 230             | 1.5°                         |
| 231             | 1.5°                         |
| 232             | 2.5°                         |
| 239             | 1.5°                         |
| 240             | 2°                           |
| 241             | 2.5°                         |

## Roller Guidance Designs

The sketches above show six types of roller guidance.

- C : 2 pressed sheet steel cages, rollers guided on a floating ring
- CA : 1 piece brass cage, roller guided between 2 inner ring flanges. Cage is guided on the rollers. Assymetrical roller position.
- GMEX : 1 piece brass cage, roller guided between 2 inner ring flanges. Cage is guided on the rollers. Assymetrical roller position.
- MB : 2 piece brass cage, roller guided between 2 inner ring flanges and one central rib. Cage is guided on the inner ring.
- VS C4 F80 : 1 piece brass cage, roller guided between 2 inner ring flanges. Cage is guided on the outer ring.
- MA C4 F80 : 2 piece brass cage, roller guided between 2 inner ring flanges and one central rib. Cage is guided on the outer ring.

Spherical roller bearings are manufactured with tapered bore-K(1:12) and K30 (1:30) with lubrication groove and 3 lubrication holes on the outside diameter W33. All Rollway sphericals have the W33 feature.

## Tolerances

Spherical roller bearings with cylindrical and tapered bore are generally manufactured to “PO” precision class.

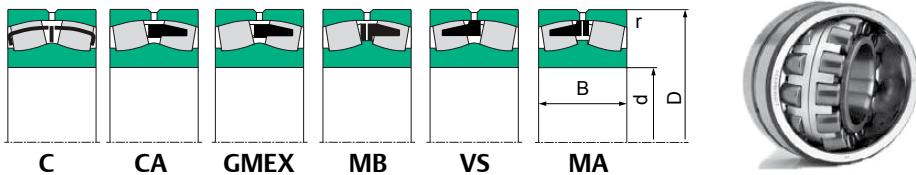

## Radial Clearance

Spherical roller bearings with cylindrical and tapered bore are generally manufactured to normal (CN), C2, C3, C4 and C5 clearances.

## Heat Treatment

Spherical roller bearings with outside diameter D>240mm of all series given in this catalog can be used to an operating temperature of +150°C (+302°F). Small size bearings operate normally at temperatures up to +120°C (+248°F).

# ADAPTER SLEEVES

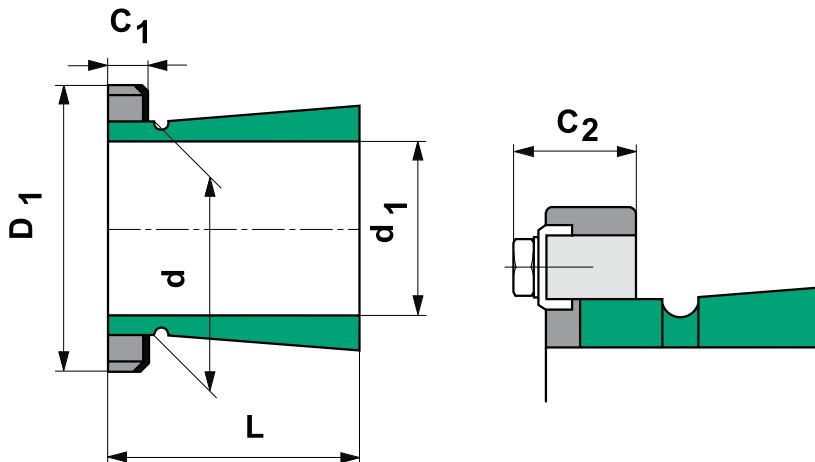

## Dimensions in accordance with ISO 2982-1995

Adapter sleeves are used to locate tapered bore bearings on cylindrical shafts. This allows less accurate machining of the shafts and ease of location.

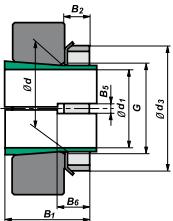

Adapter sleeves are available in metric or inch bore sizes - the external taper is 1:12.

See page 72 for tolerances.

Hydraulic sleeves are available from 200mm bore diameter. Suffix: OH

# TAPERED ROLLER BEARINGS

## Dimensions in accordance with ISO 355-2007

Tapered roller bearings are designed to take radial and thrust loads from one direction. They consist of the inner race (cone), with cage guided rollers, and the outer race (cup). The track has the same profile as the tapered rollers. The extension of the contact lines meet at a common point on the bearing axis of rotation. The cone and cup are separable. By using two bearings as opposed mountings, they can carry thrust loadings in both directions.

Single row tapered roller bearings can be supplied matched in “DB” or “DF” arrangement. These matched bearings are manufactured so that, when mounted opposite each other, the pair should have an established initial axial clearance and a uniform distribution of the loading. Matched bearings are used when the load carrying capacity of a single bearing is insufficient, or when the thrust loads have to be carried at a certain axial clearance in both directions.

### Axial clearance

The axial clearance of single tapered roller bearings is adjusted on assembly.

With matched bearings, as with double and 4 row bearings, axial clearance is achieved by the addition of spacer rings ground to give the required clearance.

Radial clearances for double and four row tapered roller bearings are shown in the technical section. The radial clearance is transformed into axial clearance by the following relation:

$$\text{Axial clearance} = \frac{\text{Radial clearance}}{2 \tan \alpha}$$

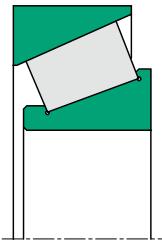

where:

$\alpha$  = contact angle between rollers and the outer ring raceway

# THRUST BALL BEARINGS

## Dimensions in accordance with ISO 104-2002

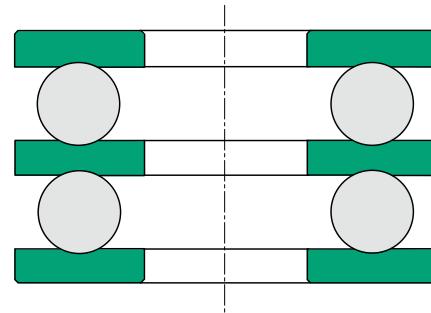

Thrust ball bearings are available in single and double acting versions. They sustain axial loads only, and therefore should not be used where radial loads are present.

The thrust loading should not drop below a minimum axial load, maintaining contact between the balls and the track when centrifugal forces are present.

They are manufactured in the following series: 511, 512, 513, 514, 522, 523 and 524.

511, 512, 513, 514

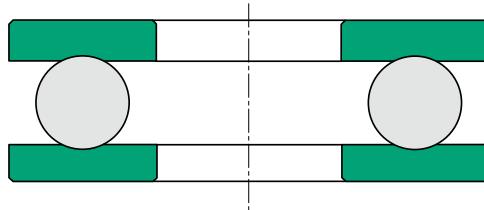

522, 523, 524

# THRUST BALL BEARINGS

## Single-acting thrust ball bearings

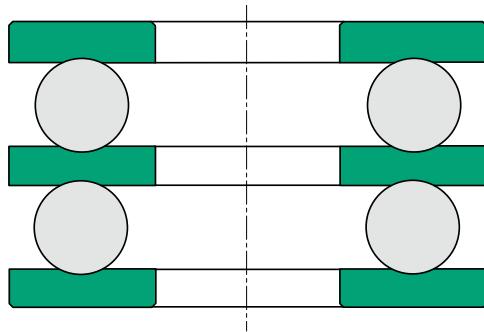

Single acting thrust ball bearings are used to carry thrust loads in only one direction and cannot carry radial loads. They are made up of a shaft washer, a flat housing washer and a ball and cage assembly. These bearings can be easily mounted by separately fitting each washer.

## Double-acting thrust ball bearing

These bearings can carry thrust loadings in both directions. They are fitted with an extra thrust washer and two ball and cage assemblies.

See technical section for further information.

## Minimum load

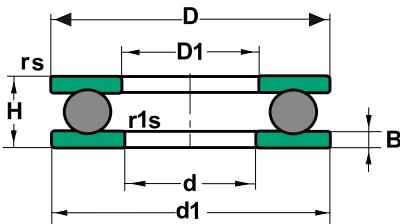

The thrust ball bearing requires a minimum axial load, so that the rolling elements maintain rolling contact and sliding is minimized. "Fam" can be obtained from formula:

$$F_{am} = M \left[ \frac{n \text{ Max}}{1000} \right]^2 [N]$$

where:

- |     |   |                         |
|-----|---|-------------------------|
| Fam | = | minimum thrust load (N) |
| M   | = | Factor for minimum load |
| n   | = | speed in RPM            |

# SPHERICAL ROLLER THRUST BEARINGS

## Dimensions in accordance with ISO 104-2002

These bearings are designed to accommodate heavy thrust loads. Due to raceways being inclined to the bearings axis, they can also accommodate radial loads up to a maximum of 55% of the thrust load and are suitable for taking high thrust loads at relatively high speed. Misalignment varies per series; figures are shown below.

| Series | Misalignment |
|--------|--------------|
| 292    | 2°           |
| 293    | 2.5°         |
| 294    | 3°           |

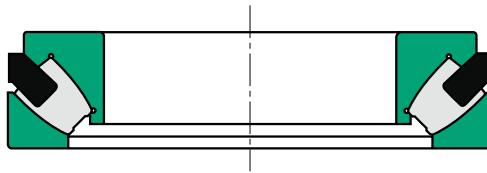

The bearings are fitted with asymmetrical barrel-shaped rollers. Dimensions conform to ISO 104-2002. In general, lubrication of these bearings should be with oil except in certain exceptional cases. It is also essential that a minimum thrust load be present to avoid damage to the raceways by centrifugal forces (see formula below).

$$F_a \text{ min} = \frac{1.5 \text{ cor}}{1000} \text{ [KN]}$$

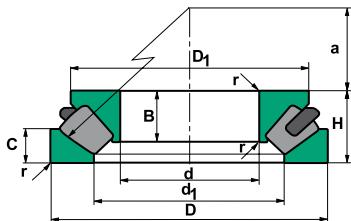

where:

Fa min = minimum thrust load [KN]

Cor = static capacity [KN]

## OTHER PRODUCTS

The Rollway production program also includes:

- Slewing ring bearings
- Full complement cylindrical roller bearings
- Tandem thrust bearings
- Multi stage thrust bearings
- Cross roller bearings
- Screw down bearings

## SI-Standard

### Force

|                   |                   |
|-------------------|-------------------|
| 1KN ( kilonewton) | = 1000 N = 102 kp |
| 1 kp              | = 9.81 N          |

### Pressure

|                        |                                      |
|------------------------|--------------------------------------|
| 1 bar = 10 N/cm        | = 1.02 kp/cm <sup>2</sup>            |
| 1 kp / cm <sup>2</sup> | = 9.81 N/cm <sup>2</sup> = 0.981 bar |

### Mechanical stress, surface pressure

|                      |                            |
|----------------------|----------------------------|
| 1 N/mm <sup>2</sup>  | = 1 MPa (megapascal)       |
|                      | = 0.102 kp/mm <sup>2</sup> |
| 1kp /mm <sup>2</sup> | = 9.81 N/mm <sup>2</sup>   |

### Torsional moment

|       |             |
|-------|-------------|
| 1Nm   | = 0.102 kpm |
| 1 kpm | = 9.81Nm    |

### Output

|        |                       |
|--------|-----------------------|
| 1w     | = 1 J/s = Nm/s        |
|        | = 0.102 kpm/s         |
| 1 kW   | = 1.36 hp = 102kpm/s  |
| 1 hp   | = 0.736 kW = 75 kpm/s |
| 1kpm/s | = 9.81 W              |

### Kinematic viscosity

|                     |                        |
|---------------------|------------------------|
| 1mm <sup>2</sup> /s | = 1 cSt ( centistokes) |
|---------------------|------------------------|

All sales are made on our STANDARD TERMS AND CONDITIONS OF SALE in effect at the time a customer's order is accepted. The current Terms and Conditions are set forth below:

## **STANDARD TERMS AND CONDITIONS OF SALE (February 2015)**

These Terms and Conditions, the attendant quotation or acknowledgment and all documents incorporated by specific reference therein, will be the complete and exclusive statement of the terms of the agreement governing the sale of goods ("Goods") by Regal Beloit America Inc. and its divisions and subsidiaries ("Seller") to Customer ("Buyer"). Buyer's acceptance of the Goods will manifest Buyer's assent to these Terms and Conditions. If these Terms and Conditions differ in any way from the terms and conditions of Buyer's order, or other documentation, this document will be construed as a counteroffer and will not be deemed an acceptance of Buyer's terms and conditions which conflict herewith.

**1. PRICES:** Unless otherwise specified in writing by Seller, Seller's price for the goods shall remain in effect for thirty (30) days after the date of Seller's quotation or acknowledgment of Buyer's order for the Goods, whichever occurs first, provided an unconditional, complete authorization for the immediate shipment of the Goods is received and accepted by Seller within such time period. If such authorization is not received by Seller within such thirty (30) day period, Seller shall have the right to change the price for the Good to Seller's price for the Goods at the time of shipment.

**2. TAXES:** Any tax or governmental charge or increase in same hereafter becoming effective increasing the cost to Seller of producing, selling or delivering the Goods/provision of Services or of procuring material used therein, and any tax now in effect or increase in same payable by the Seller because of the manufacture, sale or delivery of the Goods/provision of Services, may at Seller's option, be added to the price.

**3. TERMS OF PAYMENT:** Subject to the approval of Seller's Credit Department, terms are net thirty (30) days from date of Seller's invoice in U.S. currency. If any payment owed to Seller is not paid when due, it shall bear interest, at a rate to be determined by Seller, which shall not exceed the maximum rate permitted by law, from the date on which it is due until it is paid. Seller shall have the right, among other remedies, either to terminate the Agreement or to suspend further performance under this and/or other agreements with Buyer in the event Buyer fails to make any payment when due. Buyer shall be liable for all expenses, including attorneys' fees, relating to the collection of past due amounts.

**4. SHIPMENT AND DELIVERY:** Shipments are made F.O.B. Seller's shipping point. Any claims for shortages or damages suffered in transit shall be submitted by the Buyer directly to the carrier. While Seller will use all reasonable commercial efforts to maintain the delivery date for the Goods or the date of provision of Services acknowledged or quoted by Seller, all such dates are approximate. Seller reserves the right to make partial shipments and to segregate "specials" and made-to-order Goods from normal stock Goods. Seller shall not be bound to tender delivery of any Goods for which Buyer has not provided shipping instructions.

**5. QUANTITY:** Buyer agrees to accept overruns of up to ten percent (10%) of the order on "made-to-order" Goods, including parts. Any such additional items shall be priced at the price per item charged for the specific quantity ordered.

**6. LIMITED WARRANTY:** Subject to the limitations of Section 7, Seller warrants that the Goods will be free from defects in material and workmanship under normal use, service and maintenance and Services will be performed by trained personnel using proper equipment and instrumentation for the particular Service provided. Any licensed firmware embodied in the Goods will execute the programming instructions provided by Seller. The foregoing warranties will apply until the expiration of the applicable warranty period. Except as specified below, Goods are warranted for twelve (12) months (unless otherwise specified by Seller in writing) from the date of shipment of the Goods by Seller. Consumable and Services (except as specified below) are warranted for a period of 90 days from the date of shipment or completion of the Services. Products purchased by Seller from a third party for

resale to Buyer ("Resale Products") shall carry only the warranty extended by the original manufacturer. Buyer agrees that Seller has no liability for Resale Products beyond making a reasonable commercial effort to arrange for procurement and shipping of the Resale Products. **THIS IS THE SOLE AND EXCLUSIVE WARRANTY GIVEN BY SELLER WITH RESPECT TO THE GOODS/SERVICES AND IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, ARISING BY OPERATION OF LAW OR OTHERWISE, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WHETHER OR NOT THE PURPOSE OR USE HAS BEEN DISCLOSED TO SELLER IN SPECIFICATIONS, DRAWINGS OR OTHERWISE, AND WHETHER OR NOT SELLER'S PRODUCTS ARE SPECIFICALLY DESIGNED AND/OR MANUFACTURED BY SELLER FOR BUYER'S USE OR PURPOSE.**

This warranty does not extend to any losses or damages due to misuse, accident, abuse, neglect, normal wear and tear, unauthorized modification or alteration, use beyond rated capacity, or improper installation, maintenance or application. To the extent that Buyer or its agents has supplied specifications, information, representation of operating conditions or other data to Seller in the selection or design of the Goods or provision of Services and the preparation of Seller's quotation, and in the event that actual operating conditions or other conditions differ from those represented by Buyer, any warranties or other provisions contained herein which are affected by such conditions shall be null and void. If within thirty (30) days after Buyer's discovery of any warranty defects within the warranty period, Buyer notifies Seller thereof in writing, Seller shall, at its option, repair, correct, or replace F.O.B. point of manufacture, or refund the purchase price for, that portion of the goods found by Seller to be defective. Failure by Buyer to give such written notice within the applicable time period shall be deemed an absolute and unconditional waiver of Buyer's claim for such defects. Goods repaired or replaced during the warranty period shall be covered by the foregoing warranty for the remainder of the original warranty period or ninety (90) days, whichever is longer. Buyer assumes all other responsibility for any loss, damage, or injury to persons or property arising out of, connected with, or resulting from the use of Goods, either alone or in combination with other products/components.

**SECTIONS 6 AND 7 APPLY TO ANY ENTITY OR PERSON WHO MAY BUY, ACQUIRE OR USE SELLER'S GOODS, INCLUDING ANY ENTITY OR PERSON WHO BUYS THE GOODS FROM SELLER'S DISTRIBUTOR AND SUCH ENTITY OR PERSON SHALL BE BOUND BY THE LIMITATIONS THEREIN.**

**7. LIMITATION OF REMEDY AND LIABILITY:** **THE SOLE AND EXCLUSIVE REMEDY FOR BREACH OF ANY WARRANTY HEREUNDER (OTHER THAN THE WARRANTY PROVIDED UNDER SECTION 13) SHALL BE LIMITED TO REPAIR, CORRECTION, REPLACEMENT, OR REFUND OF THE PURCHASE PRICE UNDER SECTION 6.** SELLER SHALL NOT BE LIABLE FOR DAMAGES CAUSED BY DELAY IN PERFORMANCE AND IN NO EVENT, REGARDLESS OF THE FORM OF THE CLAIM OR CAUSE OF

**ACTION (WHETHER BASED IN CONTRACT, INFRINGEMENT, NEGLIGENCE, STRICT LIABILITY, OTHER TORT OR OTHERWISE), SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXCEED THE PRICE TO BUYER OF THE SPECIFIC GOODS OR SERVICES PROVIDED BY SELLER GIVING RISE TO THE CLAIM OR CAUSE OF ACTION. BUYER AGREES THAT IN NO EVENT SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXTEND TO INCLUDE INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES. THE TERM "CONSEQUENTIAL DAMAGES" SHALL INCLUDE, BUT NOT BE LIMITED TO, LOSS OF ANTICIPATED PROFITS, LOSS OF USE, LOSS OF REVENUE, COST OF CAPITAL AND DAMAGE OR LOSS OF OTHER PROPERTY OR EQUIPMENT AND COSTS INCURRED INCLUDING WITHOUT LIMITATION FOR CAPITAL, FUEL AND POWER, AND CLAIMS OF BUYER'S CUSTOMERS. GOODS AND/OR SERVICES SOLD HEREUNDER ARE NOT FOR USE IN ANY NUCLEAR AND RELATED APPLICATIONS.**

Buyer accepts goods and/or services with the foregoing understanding, agrees to communicate the same in writing to any subsequent purchaser or users and to defend, indemnify and hold harmless Seller from any claims, losses, suits, judgments and damages, including incidental and consequential damages, arising from such use, whether the cause of action be based in tort, contract or otherwise, including allegations that the Seller's liability is based on negligence or strict liability.

**8. BUYER RESPONSIBILITIES:** Buyer shall provide Seller ready access to the site where services are to be performed and adequate workspace and facilities to perform same as provided in these terms and conditions. Buyer shall not require Seller or its employees, as a condition to site access or otherwise, to further agree or enter into any agreement, which waives, releases, indemnifies or otherwise limits or expands any rights or obligations whatsoever. Any such agreements shall be null and void. Buyer shall inform Seller, in writing, at the time of order placement, of any known hazardous substance or condition at the site, including, but not limited to, the presence of asbestos or asbestos containing materials, and shall provide Seller with any applicable Material Data Safety Sheets regarding same. Buyer shall appoint a representative familiar with the site and the nature of the services to be performed by Seller to be present at all times that Seller personnel are at the site. Seller shall not be liable for any expenses incurred by Buyer in removing, replacing or refurbishing any Buyer equipment or any part of Buyer's building structure that restricts Seller access. Buyer personnel shall cooperate with and provide all necessary assistance to Seller. Seller shall not be liable or responsible for any work performed by Buyer.

**9. BUYER SUPPLIED DATA:** To the extent that Seller has relied upon any data or information supplied by Buyer to Seller ("Data") in the selection or design of the Goods and/or provision of the Services and the preparation of Seller's quotation, and the Data is inadequate or inaccurate, any warranties or other provisions contained herein which are affected by such conditions shall be null and void.

**10. TECHNICAL ADVICE:** It is expressly understood that the Seller assumes no obligation or liability for any technical advice given without charge and furnished by the Seller with respect to the use of the Goods. All such technical advice, or results obtained, is given and accepted at Buyer's risk.

**11. EXCUSE OF PERFORMANCE:** Seller shall not be liable for delays in performance or for nonperformance due to acts of God, acts of Buyer, war, riot, fire, flood, other severe weather, sabotage, or epidemics; strikes or labor disturbances; governmental requests, restrictions, laws, regulations, orders or actions; unavailability of or delays in transportation; default of suppliers; or unforeseen circumstances or any events or causes beyond Seller's reasonable control. Deliveries of Goods or provision of Services may be suspended for an appropriate period of time as a result of the foregoing. If Seller determines that its ability to supply the total demand for the Goods, or to obtain material used

directly or indirectly in the manufacture of the Goods, is hindered, limited or made impracticable due to causes addressed in this Section 8, Seller may allocate its available supply of the Goods or such material (without obligation to acquire other supplies of any such Goods or material) among itself and its purchasers on such basis as Seller determines to be equitable without liability for any failure of performance which may result there from. Deliveries suspended or not made by reason of this section may be canceled by Seller upon notice to Buyer without liability, but the balance of the agreement shall otherwise remain unaffected.

**12. CANCELLATIONS AND DELAYS:** The Buyer may cancel orders only upon written notice and upon payment to Seller of cancellation charges which include, among other things, all costs and expenses incurred and commitments made by the Seller and a reasonable profit thereon. Any request by Buyer to extend the delivery schedule must be agreed to in writing by the Seller. If agreement cannot be reached, Seller may deliver product or provide services to the last known ship to address and invoice the Buyer upon completion of the product or services or prior delivery date, whichever is later.

**13. CHANGES:** Buyer may request changes or additions to the Goods/Services consistent with Seller's specifications and criteria. In the event such changes or additions are accepted by Seller, Seller may revise the price and delivery schedule. Seller reserves the right to change designs and specifications for the Goods or Services without prior notice to Buyer, except with respect to Goods being made-to-order for Buyer. Seller may cancel any order or terminate any agreement without liability to Buyer if Buyer fails to meet the conditions specified herein.

**14. TOOLING:** Tool, die, and pattern charges, if any, are in addition to the price of the Goods/Services and are due and payable upon completion of the tooling. All such tools, dies and patterns shall be and remain the property of Seller. Charges for tools, dies, and patterns do not convey to Buyer, title, ownership interests in, or rights to possession or removal, nor prevent their use by Seller for other purchasers, except as otherwise expressly provided by Seller and Buyer in writing with reference to this provision.

**15. SOFTWARE AND FIRMWARE:** Notwithstanding any other provision herein to the contrary, Seller or applicable third party owner shall retain all rights of ownership and title in its respective firmware and software, including all copyrights relating to such firmware and software and all copies of such firmware and software. Except as otherwise provided herein, Buyer is hereby granted a nonexclusive, royalty free license to use firmware and software, and copies of firmware and software, incorporated into the Goods only in conjunction with such Goods and only at the Buyer's plant site where the Goods are first used. Buyer's use of certain firmware (as specified by Seller) and all other software shall be governed exclusively by Seller's and/or third party owner's applicable license terms.

**16. ASSIGNMENT:** Buyer shall not assign its rights or delegate its duties hereunder or any interest therein or any rights hereunder without the prior written consent of the Seller, and any such assignment, without such consent, shall be void.

**17. PATENTS AND COPYRIGHTS:** Subject to Section 7, Seller warrants that the Goods and/or Services sold, except as are made specifically for Buyer according to Buyer's specifications, do not infringe any valid U.S. patent or copyright in existence as of the date of delivery. This warranty is given upon the condition that Buyer promptly notify Seller of any claim or suit involving Buyer in which such infringement is alleged, and, that Buyer cooperate fully with Seller and permit Seller to control completely the defense or compromise of any such allegation of infringement. Seller's warranty as to use only applies to infringements arising solely out of the inherent operation (i) of such Goods, or (ii) of any combination of Goods in a system designed by Seller. In the event such Goods and/or Services, singularly or in combination, are held to infringe a U.S. patent or copyright in such suit, and the use of such Goods and/or Services is enjoined, or in the case of a compromise by Seller, Seller shall have the

right, at its option and expense, to procure for Buyer the right to continue using such Goods or providing such Services, or replace them with non-infringing Goods or Services; or modify same to become non-infringing; or grant Buyer a credit for the depreciated value of such Goods and accept return of them or grant Buyer a credit for such provided Services.

**18. EXPORT/IMPORT:** Buyer agrees that all applicable import and export control laws, regulations, orders, and requirements, including without limitation those of the United States and the European Union, and the jurisdictions in which the Seller and the Buyer are established or from which Goods may be supplied, will apply to their receipt and use. In no event shall Buyer use, transfer, release, import, or export Goods in violation of such applicable laws, regulations, orders or requirements.

**19. HIRING/EMPLOYEES:** Buyer agrees that during the execution of Services by Seller and for a period of twelve (12) months after the performance of Services, it will not hire any employee(s) of Seller and will not entice or counsel any such employee(s) to leave Seller's employ. Buyer agrees that this covenant shall extend to its agents and affiliates. In the event that an employee of Seller is hired or leaves the employ of Seller in such circumstances, Buyer shall pay Seller, as compensation for the cost incurred by Seller in recruiting and training the employee, the sum equivalent to six (6) months pay for each employee hired from or leaving the employment of Seller.

**20. EMPLOYEE SAFETY AND SUSPENSION OF SERVICES:** Seller may suspend or terminate Services, at its sole discretion, without liability to Buyer if Buyer fails to meet its obligations hereunder or becomes bankrupt or insolvent or if Seller determines that continuing to provide Services represents a hazardous condition for its employees.

**21. MISCELLANEOUS:** These terms and conditions set forth the entire understanding and agreement between Seller and Buyer, and supersede all other communications, negotiations and prior oral or written statements regarding the subject matter of these terms and conditions. No change, modification, rescission, discharge, abandonment, or waiver of these terms and conditions of Sale shall be binding upon the Seller unless made in writing and signed on its behalf by an officer of the Seller. No conditions, usage or trade, course of dealing or performance, understanding or agreement purporting to modify, vary, explain, or supplement these Terms and Conditions shall be binding unless hereafter made in writing and signed by the party to be bound, and no modification shall be affected by the acceptance of purchase orders or shipping instruction forms containing terms at variance with or in addition to those set forth herein. Any such modifications or additional terms are specifically rejected by Seller. No waiver by Seller with respect to any breach or default or any right or remedy and no course of dealing, shall be deemed to constitute a continuing waiver of any other breach or default or of any other right or remedy, unless such waiver be expressed in writing and signed by the party to be bound. Seller is not responsible for typographical or clerical errors made in any quotation, orders or publications. All such errors are subject to correction. The validity, performance, and all other matters relating to the interpretation and effect of this contract shall be governed by the law of the state of New York. The United Nations Convention on the International Sale of Goods shall not apply to any transaction hereunder.

#### APPLICATION CONSIDERATIONS

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and its affiliates with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, Disclaimers of Warranty, Limitation of Liability and Remedy, please contact Customer Service at 1-800-626-2120. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal Beloit America Inc. product referred to herein, including any person who buys from a licensed distributor of these branded products.
